The xlayouts package. *

Dr. Yiannis Lazarides
yannislaz@gmail.com

2012/05/26

Abstract

Current layout packages, such as the layout and layouts packages do not easily permit, the drawing of grids. The package geometry darws a page layout, but does not indicate clearly what each line represents. The need for this package arose when I was developing different page layouts for chapter heads. It has a number of utilities, one of which is shown in this publication. An extensive list of styling options is provided via a key-value interface. The package also provides macros for readability checks.

1 How to use the package

The package is used like any other LaTeX package, by including it in the preamble:

```
\usepackage{xlayouts}
```

It is recommended that options be loaded using the `\cxset` macro.

```
% \cxset{geometry units=in}
```

2 Introduction

This package is a re-implementation of the Peter Wilson's layouts package. It follows the tradition originally implemented in the `layout.sty` of Kent McPherson. It defines the command `xlayout` that draws the page geometry on the current page. The package offers additional features, such as styling commands and diverges from tradition, in that it shows the dimension lines and value labels, making understanding of the arithmetic involved easier. It works in all the major classes.

This manual is typesets according to the conventions of the LaTeX `docstrip` utility which enables the automatic extraction of the LaTeX macro source files [GMS94].

3 Producing pages two-up

Sometimes it is instructive to view your own document in a two page view. This is probably easy with a viewer such as Acrobat Reader, but not so easy to print them on paper. We offer a facility to do this in the macros that follow:

$\text{\textheight } 598\text{ pt}$

4 Page Layouts

There are a number of ways you can include a page layout in your document.

5 Implementation

The implementation, uses PGF to set the key value parameters and TikZ to draw the layout. We try to avoid clashes with other packages by using the suffix `@cx` for all internal macros.

5.1 Dependencies

5.1.1 latex.ltx

5.1.2 xcolor.sty

`xlayouts`'s colour handling depend on the `xcolor` package. The following internal macros are used directly: `\@declaredcolor`, `\current@color`, `\set@color`, `\set@page@color`

```
1
2 \global\let\tikz@ensure@dollar@catcode=\relax %supress error with verbatim
3
```

$\text{\footskip } 30\text{ pt}$

$\text{\marginparsep } 11\text{ pt}$

$\text{oddsidemargin } 28\text{ pt}$

$\text{\textwidth } 380\text{ pt}$

$\text{\marginparwidth } 101\text{ pt}$

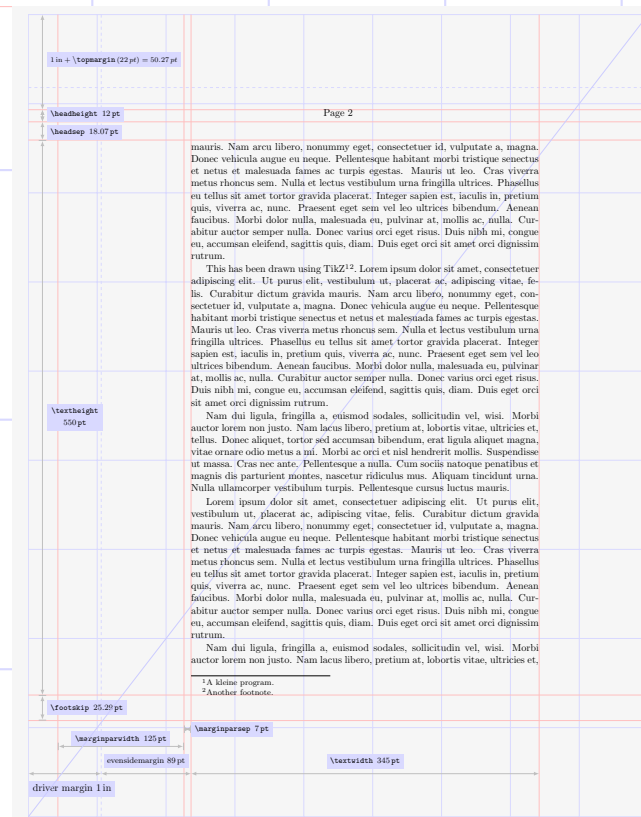

$\text{driver margin } 1\text{ in}$

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

Figure 2: Test

5.2 Internationalization

Most of the package options, are set via keys before drawing the layouts. However we provide some keys to set languages, if the option is passed via babel or through the package options.

In the figures several words appear. They are stored in control sequences to be able to select a different language. Most of the languages I am unfamiliar with, so please if you can improve the spelling or find mistakes, let me know.

I have used for the first time in a larger Project the translator package.

If your language is not represented here, you can create a dictionary and perhaps send me a copy to include in the next release. First when we create a dictionary we give it a name. The name of the dictionary must start with its kind. The kind tells translator which kind of keys the dictionary contains. For example, the dictionaries of the kind translator-months-dictionary contain keys like January (note that this is a key, not a translation). Following the kind, the name of a dictionary must have a dash. Then comes the language for which the dictionary

le provides translations. Finally, the file name must end with `.dict`. Have a look at the one's provide with the package.

```
16 \ifpackageloaded{babel}{%
17 \IfFileExists{translator.sty}
```

```

24    \usedictionary{pages}
25    \DeclareOption{german}{\uselanguage{german}}
26    \DeclareOption{english}{\select@language{english}\uselanguage{english}}
27    \DeclareOption{italian}{\select@language{italian}\uselanguage{italian}}
28    \DeclareOption{dutch}{\select@language{dutch}\uselanguage{dutch}}
29    \DeclareOption{french}{\select@language{french}\uselanguage{french}}
30    \ProcessOptions*
```

5.3 New lengths and switches

We need a few new lengths for arranging the grid and the layout. PH = paper height PW = paper width tol=tolerance toly = ytolerance

```
31    \newlength\shiftx@cx
32    \newlength\shifty@cx
33    \newlength\tol
34    \newlength\toly
35    \newlength\innermargin
36    \newlength\PH
37    \setlength\PH{\paperheight}
38    \newlength\PW
39    \setlength\PW{\paperwidth}
40    \newlength\INNER
41    \newlength\TOP
42    \newlength\alphlength
```

\textheight
598 pt

5.4 Colors

One of the reasons that I have created the package is to provide better looking layouts to be included in tutorials and or books, as such we define a number of colors to make it easy for users to redefine and change the looks.

```
43    \definecolor{theblue}{rgb}{0.02,0.04,0.48}
44    \definecolor{thered}{rgb}{0.65,0.04,0.07}
45    \definecolor{thegreen}{rgb}{0.06,0.44,0.08}
46    \definecolor{thelightgreen}{rgb}{0.06,0.44,0.06}
47    \definecolor{thegrey}{gray}{0.5}
48    \definecolor{thegray}{gray}{0.5}
49    \definecolor{thedarkgray}{gray}{0.95}
50    \definecolor{theshade}{gray}{0.94}
51    \definecolor{theframe}{gray}{0.75}
52    \definecolor{thecream}{rgb}{1,0.95,0.4}
53    \definecolor{spot}{rgb}{0,0.2,0.6}
54    \definecolor{boxframe}{gray}{0.8}
55    \definecolor{boxfill}{rgb}{0.95,0.95,0.99}
56    \definecolor{theoption}{rgb}{0.118,0.546,0.222}
57    \definecolor{themacro}{rgb}{0.784,0.06,0.176}
```

115      \fi
116      \fi
117      \fi
118      }
```

\convert@cx The macro \convert@cx is used internally to convert dimensions from one set of units to another. Used in dimension lines.

```
119      \newcommand\convert@cx[1]{%
120      \pgfmathparse{#1*\l@yunitperpt}
121      % use pgfmath for rounding to 2 decimals
122      \pgfmathprintnumber{\pgfmathresult}\thinspace\l@yunits
123      }
```

\calcshift@cx Helper command to reposition the grid, note it needs to run twice to position the grid properly.

```
124      \newcommand\calcshift@cx{%
125      \pgfsys@getposition{\pgfpictureid}\@basepoint
126      \pgf@process{\pgfpintorigin\@basepoint}%
127      \setlength\shiftx@cx\pgf@x
128      \setlength\shifty@cx\pgf@y}
```

\CS

```
129      \newcommand\CS[1]{\footnotesize #1}
```

\labelit@cx The macro \labelit@cx, is the main styling command for labels on dimensions this is expected to get more intelligent in future versions.

```
130      \newcommand\labelit@cx[1]{\ttfamily\CS{\string#1} \convert@cx{#1}}
```

We define its own family of keys.

\cxset The macro \cxset is used to either define a new key or set an existing one.

```
131      \@ifundefined{cxset}{%
132      \newcommand\cxset{\pgfqkeys{/phd}
133      }}{} %Notice this is pgf q keys
```

5.5 Keys

We are now ready to start defining keys. We use PGF Keys to define the keys.

```
134      \cxset{geometry units/.code=\printinunitsof@cx{#1},
135      geometry grid color/.store in=\geometrygridcolor@cx,
136      geometry lines color/.store in=\geometrylinescolor@cx,
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 8

\headheight 12 pt

\headsep 25 pt

```
137 geometry label color/.store in=\geometrylabelcolor@cx,  
138 geometry diagonal/.is choice,  
139 geometry diagonal/true/.code=\@diagonaltrue,  
140 geometry diagonal/false/.code=\@diagonalfalse,  
141 geometry diagonal/none/.code=\@diagonalfalse,  
142 geometry diagonal color/.store in=\diagonalcolor@cx,  
143 geometry dim arrow type/.store in=\geometryarrowtype@cx,  
144 geometry grid xsteps/.store in=\xsteps@cx,  
145 geometry grid ysteps/.store in=\ysteps@cx,  
146 geometry grid line width/.store in=\geometrygridlinewidth@cx,  
147 geometry driver lines/.store in=\geometrydriverlines@cx,  
148 geometry driver lines color/.store in=\geometrydriverlinescolor@cx,  
149 }
```

We set some defaults to initialize the keys and prevent errors, if the user doesn't specify any parameters.

```
150 \cxset{geometry diagonal=true,  
151         geometry diagonal color=blue!20,  
152         geometry lines color=pink,  
153         geometry label color=blue!15,  
154         geometry grid color=blue!15,  
155         geometry grid line width=0.8pt,  
156         geometry dim arrow type=latex,  
157         geometry units=pt,  
158         geometry grid xsteps=9,  
159         geometry grid ysteps=9,  
160         geometry driver lines=dashed,  
161         geometry driver lines color=blue!15}
```

\textheight
598 pt

\agrid The macro \agrid is the main drawing command. It draws the layout.

```
162  
163 \newcommand\agrid{%  
164 \tikzset{lines/.style={color=\geometrylinescolor@cx},  
165         dim/.style={color=black!25,thick,>=\geometryarrowtype@cx},  
166         dim label/.style={color=black,fill=\geometrylabelcolor@cx},  
167         grid/.style={line width=\geometrygridlinewidth@cx,  
168                     color=\geometrygridcolor@cx},  
169         driver/.style={\geometrydriverlines@cx,  
170                     \geometrydriverlinescolor@cx}}
```

```
171  
172 \begin{tikzpicture}[remember picture, overlay]
```

We need to detect if the layout is on an odd or an even page. We use the macro \checkoddpag from the changepage package. For oneside documents all pages are treated as odd and we set the switch to true.

```
173 \pgfmathsetlength{\TOP}{\PH-1in-\voffset-\topmargin-\headheight-\headsep}  
174 \checkoddpag%  
175 % for oneside we treat them as odd  
176 \if@twoside\else\oddpagetrue\fi  
177 \ifoddpag  
178     \innermargin\oddsidemargin  
179     \pgfmathsetlength{\INNER}{1in+\innermargin+\hoffset}
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight } 12\text{ pt}$$

$$\text{\headsep } 25\text{ pt}$$

```

180     \gdef\innermarginname{\CS{oddsidemargin}}%
181     \else
182         \innermargin\evensidemargin
183         \pgfmithsetlength{\INNER}{1in+\innermargin+\hoffset}
184         \gdef\innermarginname{\CS{evensidemargin}}%
185     \fi

```

We need to shift the whole layout in order to achieve an integral number of grids this is done with `\calcshift@cx`¹.

```

186     \calcshift@cx
187     \begin{scope}[xshift=-\shiftx@cx, yshift=-\shifty@cx]

```

We will first draw the grid. This is one of the main features of the package. We do this using the `grid` shape. All `\draw` commands are detailed, rather than using coordinates. This was both for me as well as future maintainers that can follow easier the steps in drawing the layout. TODO option to skip the grid

```

188     %
189     \draw [grid, xstep=\PW/\xsteps@cx, ystep=\PH/\ysteps@cx]
190         (current page.south west) grid ++(\PW,\PH);

```

5.6 The driver margins

Printer's cannot always print up to the edges of the paper. Knuth allowed a one inch margin for this which later got adopted into LaTeX.

`\hoffset` Adjustment to the one inch margins can be made by using `\hoffset` and `\voffset`. All major classes set these offsets at zero. Some packages such as the `crop` may use these to center a logical page onto the stock paper.

$$\text{\textheight } 598\text{ pt}$$

```

191     \draw [driver] (1in,0) -- (1in,\PH);
192     \draw [driver] (0,\PH-1in)-- ++(\PW,0);

```

5.7 Crop marks

If the option `crop` is set, the package will print crop marks. These are printed at the four corners of the paper.

```

193     %\draw [line width=0.4pt,color= green]
194     %   (0+8mm,\stockheight-30mm) circle(2.5mm)++(-2.5mm,0)
195     %   -- ++(20mm,0)++(-17.5mm,-2.5mm)--++(0,5mm);
196     %
197     %\draw [line width=0.4pt,color=red,]
198     %   (8+25mm,\stockheight-30mm+2.5mm) -- ++(0,20mm)
199     %   ++ (0,-2.5mm)circle(2.5mm) ++(-2.5mm,0mm) --++(5mm,0);
200
201

```

5.8 Vertical lines

For no particular reason we first draw the vertical lines. We also define some co-ordinates to reduce the verbosity of the code.

```

202     \draw [lines] (\INNER,0) -- (\INNER,\PH);

```

¹See [discussion](#) at `tex.sx`

$$\text{\footskip } 30\text{ pt}$$

$$\text{\marginparsep } 11\text{ pt}$$

$$\text{oddsidemargin } 28\text{ pt}$$

$$\text{\marginparwidth } 101\text{ pt}$$

$$\text{driver margin } 1\text{ in}$$

1 in + \topmargin (17 pt) = 55.27 pt

Page 10

\headheight 12 pt

\headsep 25 pt

```
203 \draw [lines] (\INNER+\textwidth,0) -- ++(0,\PH);
204 \ifoddpage
205 \draw[lines] (\INNER+\textwidth+\marginparsep,0)
206 -- (\INNER+\marginparsep+\textwidth,\PH);
207 \draw[lines] (\INNER+\textwidth+\marginparsep+\marginparwidth,0)
208 -- (\INNER+\marginparsep+\marginparwidth+\textwidth,\PH);
209 \else
210 \draw [lines] (\INNER-\marginparsep,0) -- ++(0,\PH);
211 \draw [lines] (\INNER-\marginparsep-\marginparwidth,0) -- ++(0,\PH);
212 \fi
```

5.9 Horizontal lines

Next we draw the horizontal lines.

```
213 \draw [lines](0,\PH-1in-\topmargin)-- ++(\PW,0);
214 \draw [lines](0,\PH-1in-\topmargin-\headheight)-- ++(\PW,0)
215 node[black,above] at ++(-0.5\PW,0){Page \thepage};
216 \draw [lines](0,\TOP) -- ++(\PW,0);
217 \draw [lines](0,\TOP-\textheight) -- ++(\PW,0);
218 \draw [lines](0,\TOP-\textheight-\footskip) -- ++(\PW,0);
```

5.10 Two column document

A two column document, just subdivides the text area into two equal parts with a gutter in between. Next we draw the vertical lines and the dimensions for two column layouts. We detect if it is a twocolumn layout using the switch \if@twocolumn defined by the standard classes in source2e.

\textheight
598 pt

```
\columnwidth
\columnsep
219 \if@twocolumn
220 \draw [lines](\INNER+\columnwidth,\TOP)-- ++(0,-\textheight);
221 \draw [lines](1in+\innermargin+\columnwidth+\columnsep,\TOP)
222 -- ++(0,-\textheight);
223 % Draw twocolumn dimension lines
224 \draw [dim,<->](\INNER, \TOP-\textheight-1.8em)
225 -- ++(\columnwidth,0) node[above, dim label]
226 at ++(-0.5\columnwidth,3pt) {\labelit@cx{\columnwidth}};
227 \draw [dim,<->](\INNER+\columnwidth, \TOP-\textheight-1.8em)
228 -- ++(\columnsep,0) node[above, dim label] at
229 ++(-0.5\columnsep,3pt) {\labelit@cx{\columnsep}};
230 \draw [dim,<->](\INNER+\columnwidth+\columnsep,
231 \PH-1in-\topmargin-\headheight-\headsep-\textheight-1.8em)
232 -- ++(\columnwidth,0) node[above, dim label] at
233 ++(-0.5\columnwidth,3pt) {\labelit@cx{\columnwidth}};
234 \fi
```

We then position and draw the dimension lines and labels.

```
235 \ifoddpage
236 \pgfmathsetlength\tol{1in+\innermargin+\textwidth+2\marginparsep}
237 \draw [dim, <->](\tol,\PH)-- ++(0,-1in-\topmargin);
238 \else
239 \pgfmathsetlength\tol{2\marginparsep}
```

\footskip 30 pt

\marginparsep 11 pt

$$1\text{ in} + \text{\topmargin} (17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

```
240 \draw [dim, <->](\tol,\PH)-- ++(0,-1in-\topmargin);
241 \fi
```

The top margin (not to be confused with the length `\topmargin`, is the total length given by the driver margin (which is `1in` + the `\topmargin` length + the `headheight` and `\headsep`.

```
242 \pgfmathsetlength\@tempdima{1in-\topmargin}
243 \ifoddpage
244 \draw [dim](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
245 node[left, dim label] at
246 ++(-1ex,0.5in+0.5\topmargin+1.5em)
247 {\scriptsize$1\thinspace \text{\in}+\texttt{\footnotesize\textbackslash topmargin}\,
248 (\convert@cx{\topmargin})= \convert@cx{\@tempdima}$};
249 \else
250 \draw [dim, <->](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
251 node[right, dim label] at ++(1ex,1in-0.5\topmargin)
252 {\scriptsize$1\thinspace \text{\in}+\texttt{\footnotesize\textbackslash topmargin}\,
253 \, (\convert@cx{\topmargin})= \convert@cx{\@tempdima}$};
254 \fi
```

5.11 headheight and headsep

The `\headheight` is normally a fixed amount that varies with the baseline of the the font. In the standard classes it is defined in the `.clo` files. We position the lines and labels on the right for odd pages and on the left for even pages.

```
255 \ifoddpage
256 \draw [dim,<->](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
257 node[above left, dim label] at ++(-1ex,0){ \labelit@cx{\headheight}};
258 % draw headsep
259 \draw [dim,<->](\tol,\PH-1in-\topmargin-\headheight)-- ++(0,-\headsep)
260 node[above left,dim label] at ++(-1ex,0){\labelit@cx{\headsep}};
261 \else
262 \draw [dim,<->](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
263 node[above right,dim label] at ++(1ex,0){ \labelit@cx{\headheight}};
264 % draw headsep
265 \draw [dim,<->](\tol,\PH-1in-\topmargin-\headheight)-- ++(0,-\headsep)
266 node[above right, dim label] at ++(1ex,0){\labelit@cx{\headsep}};
267 \fi
```

$$\text{\textheight} 598\text{ pt}$$

5.12 Text height

The `\textheight` is normally calculated to have an exact number of lines to avoid warning messages from the TeX engine.

```
268 \draw [dim, |<->](\tol,\TOP)
269 -- ++(0,-\textheight) node[right,text width=1.7cm,text centered, dim label]
270 at ++(1ex,0.5\textheight){\labelit@cx{\textheight}};
```

5.13 The footskip

The `\footskip` is also a fixed number set by the classes. We position it left or right to minimize clashes with other elements.

$$\text{\footskip} 30\text{ pt}$$

$$\text{\marginparsep} 11\text{ pt}$$

$$\text{oddsidemargin} 28\text{ pt}$$

$$\text{\textwidth} 380\text{ pt}$$

$$\text{\marginparwidth} 101\text{ pt}$$

$$\text{driver margin} 1\text{ in}$$

1 in + \topmargin (17 pt) = 55.27 pt

Page 12

\headheight 12 pt

\headsep 25 pt

```
271 \ifoddpage
272   \draw [dim, |<->|](\tol,\TOP-\textheight)
273   -- ++(0,-\footskip)
274   node[left, dim label] at ++(-1ex,0.5\footskip){\labelit@cx{\footskip}};
275 \else
276   \draw [dim, |<->|](\tol,\TOP-\textheight)
277   -- ++(0,-\footskip)

329 \toly+.95cm)--++(\marginparwidth,0)node [right, dim label]
330 at ++(0,0em)
331 {\labelit@cx{\marginparwidth}};
332 \else
333 \draw[dim,<->](\INNER-\marginparsep-\marginparwidth, \toly+.95cm)
334 --++(\marginparwidth,0)node [above, dim label] at
335 ++(-0.5\marginparwidth,0em){\labelit@cx{\marginparwidth}};
336 \fi
337 \fi
```

\textheight
598 pt

5.15 Classic layout diagonal lines

We do not attempt to draw out a full classical layout, but only to draw the diagonal lines to check. This feature can be switched off. The direction of the line depends if we have an odd or even page.

```
338 \if@diagonal
339 \ifoddpage
340 \draw [\diagonalcolor@cx,thick] (\PW,0)--(0,\PH);
341 \else
342 \draw [\diagonalcolor@cx,thick] (0,0)--(\PW,\PH);
343 \fi
344 \fi
345 \end{scope}
346 \end{tikzpicture}}
```

6 Running head definitions

We define a page layout, grid to position the grid. We use the same for both evenhead and oddhead.

\ps@grid In LaTeX a running header is defined using a \ps@<name> macro. We define a pagestyle that can be use to draw the layout.

```
347 \def\ps@grid{%
348 \let\@oddfont\@empty\let\@evenfont\@empty
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 14

\headheight 12 pt

\headsep 25 pt

```
349 \def\@evenhead{\agrid}%
350 \let\@oddhead\@evenhead
351 \let\@mkboth\@gobbletwo
352 \let\chaptermark\@gobble
353 \let\sectionmark\@gobble
354 }
```

7 Float parameters

\figureparambot The macros \figureparambot attempt to draw dimension lines in figures. This is very much work in progress, as to draw them properly will need to redefine some of the internals of the output routine.

```
355 \def\figureparamsbot{%
356 \begin{tikzpicture}[remember picture, overlay]
357 \pgfmathsetlength\@tempdima{-\textfloatsep}
358 \draw[>=latex,|<->|] (0,0) --++(0,-\@tempdima)
359 node [right]
360 at ++ (lex,-0.5\textfloatsep)
361 {\CS{textfloasep} \convert@cx{\textfloatsep}};
362 \end{tikzpicture}%
363 \par
364 }
365 \def\figureparamstop{%
366 \par
367 \begin{tikzpicture}%[remember picture, overlay]
368 \pgfmathsetlength\@tempdima{-\textfloatsep}
369 \draw[>=latex,|<->|] (0,0) --++(0,\@tempdima)
370 node [right,fill=\geometrylabelcolor@cx]
371 at ++ (lex,0.5\textfloatsep)
372 {\CS{textfloasep} \convert@cx{\textfloatsep}};
373 \end{tikzpicture}%
374 }
```

\textheight
598 pt

8 Spread

The package provides a command to draw a two page spread as per the canons of page construction.

This is aimed at producing stand alone diagrams for inclusion into other packages or LaTeX notes, such a diagram is shown in Figure 3

```
375 \newlength\paperwidth@cx
376 \newlength\paperheight@cx
377 \newlength\lefttrim
378 \newlength\bottomtrim
379 \newlength\bindingcorrection
380 \setlength\paperwidth@cx{12in}
381 \setlength\paperheight@cx{18in}
382 \setlength\bindingcorrection{0.5in}
383
384 \cxset{spread xsteps/.store in=\spreadxsteps@cx,
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 15

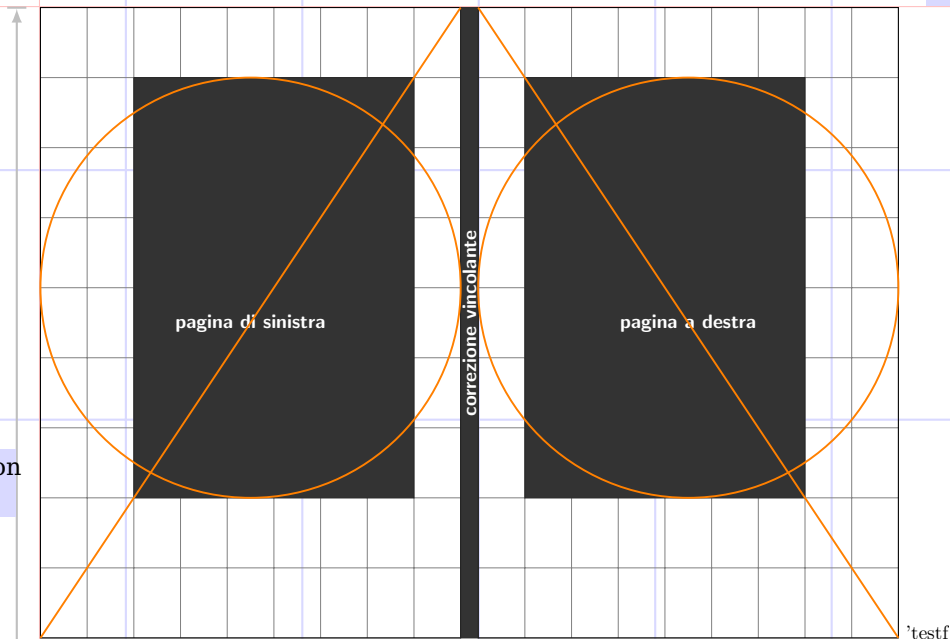

Figure 3: Diagram illustrating page geometry as per the Canons of Page Construction.

```

385         spread scale/.store in=\spreadscalescale@cx,
386         spread width/.store in=\spreadwidth@cx}
387     %
388     %
389     \cxset{spread xsteps=9,
390             spread scale=0.25,
391             spread width=0.5\textwidth}% does not work
392
393     \tikzset{typearea/.style={color=black!85,fill=black!80,
394             font={\sffamily\bfseries}}}
395     %

```

\textheight
598 pt

\drawcanons The macro \drawcanons draws a spread, showing all lines and divisions as per classical rules.

```

396     \def\drawcanons{%
397         \begin{tikzpicture}[scale=\spreadscalescale@cx]
398             % draw the two pages
399             \draw[xstep=(\paperwidth@cx)/\spreadxsteps@cx,
400                 ystep=(\paperheight@cx)/\spreadxsteps@cx,color=gray] (0,0)
401                 grid (\paperwidth@cx, \paperheight@cx);
402             \draw (0,0) rectangle (\paperwidth@cx,\paperheight@cx);
403
404             \begin{scope}[xshift=\paperwidth@cx+\bindingcorrection]
405                 \draw[xstep=(\paperwidth@cx)/9,
406                     ystep=(\paperheight@cx)/9,color=thegray] ++(0,0)
407                     grid (\paperwidth@cx, \paperheight@cx);

```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 16

\headheight 12 pt

\headsep 25 pt

```
408     \draw[color=black] (0,0) rectangle (\paperwidth@cx,\paperheight@cx);
409     \end{scope}

Next we draw the binding correction. This is drawn as a rectangle. We fill it
with the same style shading as the type area.

410     \draw[typearea, draw] (\paperwidth@cx,0)
411         rectangle ++(\bindingcorrection, \paperheight@cx);

The typed area blocks are added next.

412     \draw[typearea] (2\paperwidth@cx/\spreadxsteps@cx,
413                     2\paperheight@cx/\spreadxsteps@cx)
414         rectangle ++(6/9*\paperwidth@cx,6*\paperheight@cx/\spreadxsteps@cx);
415
416     \draw[typearea] (\paperwidth@cx+\paperwidth@cx/9+\bindingcorrection,
417                     2\paperheight@cx/9) rectangle ++(6\paperwidth@cx/9,6\paperheight@cx/9);
418
419     \ifdim\bindingcorrection>0pt
420     \begin{scope}[typearea,color=white]
421     \draw node at
422         (\paperwidth@cx+0.5\bindingcorrection,
423          0.5\paperheight@cx)[rotate=90,inner sep=0pt,outer sep=0pt]
424         {\translate{bindingcorrectionname}};
425     \fi
426     \node at
427         (0.5\paperwidth@cx,0.5\paperheight@cx){\translate{leftpagename}};
428     \node at
429         (1.5\paperwidth@cx+\bindingcorrection,
430          0.5\paperheight@cx){\translate{rightpagename}};
431     \end{scope}

Next we draw the diagonals and the circles. We draw them within a scope to
separate the styling from the drafting.

432     \begin{scope}[color=orange, line width=1pt]
433     \draw (0,0)-- (\paperwidth@cx,\paperheight@cx);
434     \draw (2\paperwidth@cx+\bindingcorrection,0)--
435         ++(-\paperwidth@cx,\paperheight@cx);

The circles are drawn in the same style as the diagonals. We do not provide
an option to change this, as it will produce ugly diagrams.

436     \draw (0.5\paperwidth@cx,5\paperheight@cx/9)
437         circle (0.5\paperwidth@cx);
438     \draw [xshift=\paperwidth@cx+\bindingcorrection]
439         (0.5\paperwidth@cx,5\paperheight@cx/9)
440         circle (0.5\paperwidth@cx);
441     \end{scope}
442     \end{tikzpicture}
443 }
```

\textheight
598 pt

9 Try Layouts

The try layouts code, are helper macros to draw dimension lines on a diagram to experiment with different dimensions and layouts. In addition to this some helper commands are incorporated for readability.

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

10 Readability

In general the width of the typed area should not exceed 45-65 characters. This is language and reader dependent.

`\alphabet` The macro `\alphabet` returns the twenty six letters of the English language. This is used later on to calculate the length of an alphabet and provide related metrics for the readability of the text.

```
444 \def\alphabet{%
445   \normalfont\selectfont\raggedleft%
446   abcdefghijklmnopqrstuvwxyz}
```

`\charactersperline` The macro `charactersperline` typesets the number of characters in a line of text. We use `\pgfmithprintnumber` to format and print the number.

```
447 \newcommand\charactersperline{%
448   \settowidth{\@tempdima}{\alphabet}
449   \pgfmithparse{\textwidth/\@tempdima*26}
450   \pgfmithprintnumber{\pgfmithresult}
451 }
```

`\alphabetsperline` Some people are more familiar with the metric alphabets per line rather than characters per line. We provide the macro `\alphabetsperline`.

```
452 \newcommand\alphabetsperline{%
453   \settowidth{\@tempdima}{\alphabet}
454   \pgfmithparse{\textwidth/\@tempdima}
455   \pgfmithresult
456 }
```

\textheight
598 pt

`\alphabetlength` The macro `\alphabetlength` prints the length of the alphabet.

```
457 \newcommand\alphabetlength{%
458   \settowidth{\alphlength}{\alphabet}
459   \pgfmithparse{\alphlength}
460   \pgfmithprintnumber{\pgfmithresult}pt
461 }
```

We need to use the `fp` package to calculate the ratios, as PGF has problems with large dimensions or I am making an error

```
462 \newcommand\textarearatio{%
463   \FPMul{\result}{\strip@pt\textwidth}{\strip@pt\textheight}
464   \FPMul{\resultii}{\strip@pt\paperwidth}{\strip@pt\paperheight}
465   \FPdiv{\resultii}{\result}{\resultii}
466   \pgfmithprintnumber{\resultii}
467 }
468
469 % Calculate the ratio textheight/paperheight
470 \newcommand\textheightratio{%
471   \FPdiv{\result}{\strip@pt\textheight}{\strip@pt\paperheight}
472   \FPround{\result}{\result}{2}
473   \result
474 }
475
```

1 in + \topmargin (17 pt) = 55.27 pt

Page 18

\headheight 12 pt

\headsep 25 pt

```
476 % Calculate textheight/paperwidth
477
478 \newcommand\textheighttopaperwidth{%
479     \pgfmathparse{\textheight/\paperwidth}
480     \pgfkeys{/pgf/number format/.cd,fixed,precision=2}
481     \pgfmathprintnumber{\pgfmathresult}
482 }
483 \newcommand\numbertextlines{%
484 % baselineskip to be corrected
485     \pgfmathparse{(\textheight-\topskip)/(12)-1}\pgfmathresult
486 }
```

\printreadability

```
487 \edef\tempbaseline{\the\baselineskip}
488 \def\printreadability{%
489 \begin{tabular}{lr}
490 Characters per line & \charactersperline\\
491 Alphabets per line & \alphabetsperline\\
492 Alphabet length & \alphabetlength\\
493 Baselineskip & \tempbaseline\\
494 Number of text lines & \numbertextlines\\
495 \end{tabular}}
496
```

This produces

Characters per line	82.27
Alphabets per line	3.1643
Alphabet length	120.09pt
Baselineskip	12.60004pt
Number of text lines	48.0

\textheight
598 pt

11 Page Layout Diagrams

This is one of the most important features of the package. Drawing and annotating a page diagram, so that you can view new geometry or use them for notes.

11.1 New lengths

We need to isolate the current page dimensions from the new trial sizes for the diagram. We redefine new lengths for all parameters with the prefix try and the suffix @cx.

```
497 \newlength\trypaperwidth@cx
498 \newlength\trypaperheight@cx
499 \newlength\trytextheight@cx
500 \newlength\tryheadheight@cx
501 \newlength\tryheadsep@cx
502 \newlength\tryfootskip@cx
503 \newlength\trymargin@cx
504 \newlength\trymarginbottom@cx
505 \newlength\trytopmargin@cx
506 \newlength\trimtop@cx
507 \setlength\trimtop@cx{0pt}
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 19

\headheight 12 pt

\headsep 25 pt

```
508 \newlength\trytextwidth@cx
509 \newlength\trymarginparwidth@cx
510 \newlength\trymarginparsep@cx
511 \newlength\tryleftmargin@cx
512 \newlength\tryinner@cx
```

The stockheight and stockwidth are used when the paper is to be trimmed they default to the dimensions for paper width and paper height, if not specified. The memoir class also defines them. If they are defined, we use the values from the class.

\stockheight

\stockwidth

```
513 \@ifundefined{stockheight}{\global\newlength\stockheight}{}
514 \@ifundefined{stockwidth}{\global\newlength\stockwidth}{}
515
516 \ifdim\stockheight=0pt\addtolength\stockheight{\paperheight}\fi
517 \addtolength\stockheight{0mm}

620
621 \cxset{try grid=true}
```

$$\text{\textheight } 598\text{ pt}$$

11.2 Allowances for trims

Throughout we are focusing on the average LaTeX user than might want to for example use A4 paper and trim down to a different size. We start from the stockwidth and stockheight and we set the paperwidth and paperheight to a smaller size to cater for these trims.

I call this process trimming in, whereas other packages such as the crop increase the paper size to allow for the trims, thus displaying a larger page. The memoir class has something similar.

```
\trypaperwidth@cx We set the length to stocksize-trimedge.
\trypaperheight@cx % set the trial paper sizes as per trim sizes
622 \addtolength\trypaperwidth@cx{\trystockwidth@cx}
623 \addtolength\trypaperwidth@cx{-\trytrimedge@cx}
624 \addtolength\trypaperheight@cx{\trystockheight@cx}
625 \addtolength\trypaperheight@cx{-\trimtop@cx}
626 \addtolength\trypaperheight@cx{-\bottomtrim}
627
```

11.2.1 Calculating the Top Margin and Bottom Margin

We calculate the top and bottom margins for convenience. Remember that so far we are only dealing with default settings. If the user changes the dimensions, these will have to be recalculated.

$$\text{\footskip } 30\text{ pt}$$

$$\text{\marginparsep } 11\text{ pt}$$

$$\text{oddsidemargin } 28\text{ pt}$$

$$\text{\textwidth } 380\text{ pt}$$

$$\text{\marginparwidth } 101\text{ pt}$$

$$\text{driver margin } 1\text{ in}$$

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

```
628 %\addtolength\trymargin@cx{1in+\voffset+\trimtop@cx}
629 %\addtolength\trymargin@cx{\dimexpr(\tryheadsep@cx+
630 % \tryheadheight@cx+\trytopmargin@cx)}
```

11.2.2 Adjustments to text height

Since we are trimming-in, our paper height will end up being smaller than the stock paper height. One is thus faced with the decision to either make the top and bottom margins smaller to allow for the trimming or to reduce the text height accordingly.

Most people and publishers are fussy about margins, so perhaps it is better to reduce the text-height. We offer a method to the user to specify preferences later on. In the meantime for the purpose of defaults, we will take all the adjustment at the bottom margin and leave the text-height untouched.

`\trytextheight@cx` Let `trytextheight@cx` equal to the current document `\textheight` value.

```
631 \setlength\trytextheight@cx{\textheight}

632 \setlength\trymarginbottom@cx{%
633 \dimexpr(\trystockheight@cx-1in-\trimtop@cx-\trytopmargin@cx
634 -\tryheadheight@cx-\tryheadsep@cx-\trytextheight@cx)\relax}

635
636
637 \newlength\stepx
```

11.3 Drawing the Trial Layout

The trial layout is drawn in a lengthy TikZ picture. If no new dimensions are provided by the user it will default to the values we have set it previously. That is the current layout values.

`\drawtriallayout` The macro `\drawtriallayout` draws the page diagram. It uses throughout trial dimensions.

```
638 \tikzset{dim/.style = {color=black,>=latex}}
639 \def\drawtriallayout{%

    We first need to check if we are on an odd or even page and set the geometry
    accordingly. If the document is one-side we default to drawing everything as an
    odd-side page.

640 \checkoddpage%

665
666     % Draw paper width dimension
667     \def\drawpaperwidththevendim{%
668         \coordinate (A) at (0+\trytriedge@cx,\tol);
669         \coordinate (B) at (\trystockwidth@cx,\tol);
670         \coordinate (C) at (0.5\trystockwidth@cx,\tol);
671         \draw[dim, |<->|] (A) -- (B);
672         \node at (C) [yshift=0.5\baselineskip]]
673         {paper width = \convert@cx{\trypaperwidth@cx} $(W_p)$};
674     }
```

11.3.1 Draw stock paper

First we draw the stockwidth and stockheight

\textheight
598 pt

```
675     \draw [color=thegray] (0,0) rectangle
676         ++(\trystockwidth@cx,\trystockheight@cx);
677
678     % draw the paper if trims are defined and no book size given
679     % the paper width is then defined by the dashed blue line
680     \ifoddpage
681         \draw [book trim] (0+\lefttrim,\trystockheight@cx-\trimtop@cx)
682             rectangle ++(\trystockwidth@cx-\lefttrim-\trytriedge@cx,
683                 -\trystockheight@cx+\trimtop@cx+\bottomtrim);
684         \drawpaperwidthdim
685     \else
686         \draw [book trim] (0+\lefttrim+\trytriedge@cx,\trystockheight@cx-\trimtop@cx)
687             rectangle ++(\trystockwidth@cx-\lefttrim-\trytriedge@cx,
688                 -\trystockheight@cx+\trimtop@cx+\bottomtrim);
689         \drawpaperwidththevendim
690     \fi
691
```

11.3.2 Draw grid

Unlike the grid on page spreads we provide a conditional to switch it off if necessary. It set to true by default.

```
692     \pgfmathsetmacro{\gridx}{10}
693     \iftrygrid
694         \ifoddpage
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 24

\headheight 12 pt

\headsep 25 pt

```
695 \draw[xstep=(\trypaperwidth@cx-\lefttrim)/\gridx,  
696 ystep=\trypaperheight@cx/\gridx,color=thegreen!50,  
697 line width=0.4pt,yshift=\bottomtrim,xshift=\lefttrim]  
698 (0,0) grid (\trypaperwidth@cx-\lefttrim,\trypaperheight@cx);  
699 \else  
700 \draw[xstep=(\trypaperwidth@cx)/\gridx,  
701 ystep=\trypaperheight@cx/\gridx,color=thegreen,  
702 line width=0.4pt,yshift=\bottomtrim,xshift=\tryrimedge@cx]  
703 (0,0) grid ++(\trypaperwidth@cx,\trypaperheight@cx);  
704 \fi  
705 \fi
```

11.3.3 Drawing the binding correction

The binding correction is added to the stockheight. It will appear on the opposite site in the even page.

```
706 \ifoddpage  
707 \draw (0, \trystockheight@cx + 3mm) -- ++ (0,1cm)  
708 ++ (\lefttrim,-1cm) -- ++(0,1cm) ++(-1cm-\lefttrim,-0.5cm)[->,>=latex]  
709 -- ++(0.5cm+\lefttrim,0);  
710 \draw (0, \trystockheight@cx + 3mm)  
711 ++ (0,0.5cm) -- ++ (\lefttrim,0)  
712 ++(1cm,0cm)[|<->,>=latex]-- ++(-1cm,0cm)  
713 node[right] at ++(1cm,0)  
714 {\translate{bindingcorrectionname}\ \convert@cx{\lefttrim} {\delta_b}\$ };  
715 \fi  
716  
717 % stockwidth dimension lines  
718 \edef\tol{-5\baselineskip}  
719 \coordinate (BD) at (0,\tol);  
720 \coordinate (BD2) at (\stockwidth,-5\baselineskip);  
721 \draw[dim,|<->|] (BD) -- (BD2);  
722 \draw (BD) ++ (0.5\stockwidth,0)  
723 node [yshift=0.5\baselineskip]  
724 {stockwidth=\convert@cx{\stockwidth} {\W_s}\$ } ;  
725  
726 % top dimension at left  
727 \coordinate (H1) at (-5mm,\trystockheight@cx-\trimtop@cx);  
728 \coordinate (H2) at (-5mm,  
729 \trystockheight@cx-1in-\trimtop@cx-\trytopmargin@cx-  
730 \tryheadheight@cx-\tryheadsep@cx);  
731 \draw [dim,|<->|] (H1) -- (H2);  
732 \node[left,text width=1.0cm, text centered,dim text] at  
733 (-5mm,\trystockheight@cx-0.5*\margintop)  
734 {top\ \convert@cx{\the\margintop}\{\h_{t}\}\$};  
735  
736 % bottom dimension at left  
737 \coordinate (H3) at (-5mm,0+\bottomtrim);  
738 \coordinate (H4) at (-5mm,\trymarginbottom@cx);  
739 \draw [dim,|<->|] (H3) -- (H4);  
740 \node[left,text width=1.5cm,text ragged left]
```

\textheight
598 pt

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 25

\headheight 12 pt

\headsep 25 pt

```
741      at (-5mm,0.5*\trymarginbottom@cx)
742      {bottom\ \convert@cx{ \the\trymarginbottom@cx}\
743        $(h_{b})$};
744
745      % textheight at left
746      \draw[dim,<->] (-5mm, \trymarginbottom@cx)
747        -- ++ (0,\trytextheight@cx);
748      \node[left,text width=1.6cm,text centered,dim text]
749        at (-5mm,\trymarginbottom@cx+0.5\trytextheight@cx)
750        {\CS{textheight} \convert@cx{\trytextheight@cx}\
751         $(h_x)$ };
752
```

11.3.4 Book height

Book sizes are specified by the size of the final trimmed sizes. for most users there is no need to worry about trims and binding corrections, however we provide these for consistency and for books that are perhaps to be sent to an on-line bureau for printing.

```
753      \draw [dim,<->] (-4.7cm,\bottomtrim) --
754        (-4.7cm,0.5\trystockheight@cx-0.5\trimtop@cx)
755        node[left,text width=1.2cm,text centered,dim text]
756        {\translate{bookheightname}\ \convert@cx{\trypaperheight@cx}} --
757        (-4.7cm,\trystockheight@cx-0.5\trimtop@cx) ;
```

11.3.5 Draw the edge trim

The paper is always assumed to be trimmed at top bottom and the edge margin. We first draw the edge trim and its dimension.

```
758      \ifdim\trytrimedged@cx>0pt
759      \ifoddpage
760        \coordinate (D) at (\trystockwidth@cx-4\trytrimedged@cx,
761          0.10\trytextheight@cx);
762        \coordinate (E) at (\trystockwidth@cx,0.10\trytextheight@cx);
763        \draw [dim,->] (D) -- ++(3\trytrimedged@cx,0);
764        \draw [dim,<-] (E) -- ++(3\trytrimedged@cx,0)
765        node at ++(0,0) [right,text width=2cm,dim text]
766        {\translate{trimedgename}\
767         \convert@cx{\the\trytrimedged@cx}
768         $(\Delta_e)$};
769      \else
770        \coordinate (D1) at (0, \trystockheight@cx+ 5mm);
771        \coordinate (E1) at ++ (\trytrimedged@cx,\stockheight+\trimtop@cx);
772        \draw (D1) -- ++ (0, 10mm) ++(\trytrimedged@cx,0) -- ++(0,-10mm) ;
773      \fi
774    \fi
```

11.3.6 The top trim

The top trim is drawn next. As it is very small normally we try not to crowd the label and the dimension lines. We will only show it if it has a value.

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

```

775 %\ifdim\trimtop>0pt
776   \coordinate (F) at (0.9\trystockwidth@cx,\trystockheight@cx-\trimtop@cx+8mm);
777   \coordinate (G) at (0.9\trystockwidth@cx,\trystockheight@cx-\trimtop@cx);
778   \coordinate (H) at (0.9\trystockwidth@cx,\trystockheight@cx);
780   \draw (F)[dim,->|,>=latex] -- (G);
781   \draw (H) -- ++ (0,8mm) -- ++ (5mm,0)[|<-|,>=latex]
782     node [text width=2cm, right] at ++ (0,3pt) {\translate{\trimtopname}\
783       \ \convert@cx{\the\trimtop@cx} {\Delta_t}$};
784 %\fi

```

11.3.7 Driver offsets

Next we draw the driver offsets. The lines are drawn at the left side of the paper both for even and for odd paper. Of course they are meaningless if the printer is going to print them on an A3 paper for example, and then the paper is trimmed.

```

785   \draw[fill=olive] (1in,\trystockheight@cx-1in) circle (1.5mm);
786   \draw[dashed,color=olive] (1in,0) -- (1in,\trystockheight@cx);
787   \draw[dashed,color=olive] (0in,\trystockheight@cx-1in)-- ++ (\trystockwidth@cx,0);
788   \draw [dim,|<->|](0,0.3cm)-- (1in,0.3cm) node at (0.5in,0.6)[dim text] {\translate{oneinch}

```

Draw the inner margin. We use innermargin which has already been set to either oddsidemargin or evensidemargin

```

789 % Draw left = 1in + innermargin
790 \setlength\tryleftmargin@cx{\dimexpr(1in+innermargin)}
791 \draw [dim,|<->|] (0in,1.9cm) -- (1in+innermargin,1.9cm)
792 node at (0.6in,3.2cm)[text width=1in,dim text,text centered]
793 {\$(w_i)\$ \ \convert@cx{\tryleftmargin@cx}\inner margin};
794
795
796 \draw (1in,1.2cm)[|<->|] -- ++(\innermargin,0) node[right,dim text]
797 {\innermarginname\ \convert@cx{\the\innermargin} {\Delta_i}$};
798
799 % add topmargin dimension
800
801 \setlength{\@tempdimc}{\dimexpr(1in-\trimtop@cx+\trytopmargin@cx)\relax}
802 \coordinate (S1) at (\trystockwidth@cx+3ex,\trystockheight@cx-\trimtop@cx);
803 \draw [dim,|<->|] (S1)
804   -- ++ (0,-\@tempdimc-\trimtop@cx)
805   node [right, dim text, text width=3.5cm] at

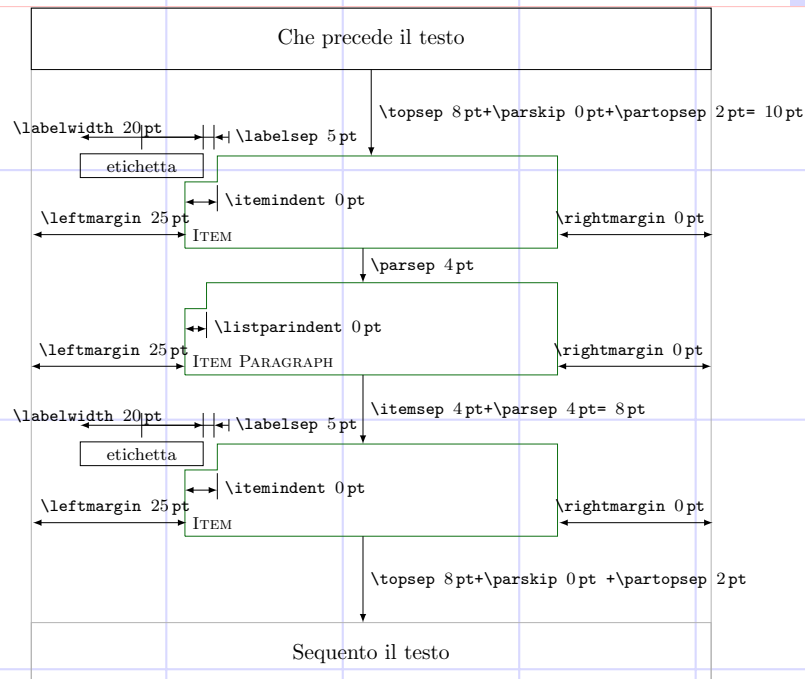

Figure 4: List diagram, showing LaTeX geometry definitions.

12 Lists

List diagrams are developed using the techniques we have used so far for the pages. We define layouts to visualize them.

`\drawlist` The macro `\drawlist` draws an outline of an enumerated or any type of list illustrating the main parameters affecting its layout. It is based on ideas presented originally in the `layouts` package and a sample is shown in figure 4

```

900 \newlength\tempa@cx
901 \newlength\tempb@cx
902 \newlength\tempc@cx
903 \newlength\listdiagramheight
904 \newlength\listdiagramwidth
905
906 \def\drawlistdiagram{%
907   \begin{tikzpicture}[scale=0.5,dim/.style={font={\footnotesize}},
908                     block/.style={color=thegreen}]
909     \pgfmathsetmacro{\yscale}{8}
910     \pgfmathsetlength{\tempa@cx}{\yscale*(\topsep+\parskip+\partopsep)}
911     \pgfmathsetlength{\tempb@cx}{\yscale*(\itemsep+\parsep)}
912     \pgfmathsetlength{\tempc@cx}{\yscale*(\parsep)}
913     \pgfmathsetlength{\listdiagramheight}{13cm+2*\tempa@cx+\tempb@cx+\tempc@cx}
914     \pgfmathsetlength{\listdiagramwidth}{\textwidth+10cm}

```

We first draw a block to reprsresent some text and the block on a page.

```

915 \draw[color=thegray!60] (0,0) rectangle (\listdiagramwidth,\listdiagramheight);

```

1 in + \topmargin (17 pt) = 55.27 pt

Page 30

\headheight 12 pt

\headsep 25 pt

```
916 \draw[color=thegray!60] (0,0) rectangle (\listdiagramwidth, 2cm);
917 \draw (0,\listdiagramheight) rectangle (\listdiagramwidth,\listdiagramheight-2cm)
918       node at ++ (-0.5\listdiagramwidth,1cm) {\translate{precedingtextname}};
919 \node at (0.5\listdiagramwidth,1cm) {\translate{followingtextname}};
```

Next we are going to draw the item shape. First we draw the rectangle with the indentation.

12.1 Tabulating List values

`\printlistvalues` The command `\printlistvalues` produces a short table showing the list parameters and their values (see Table 1 for an example).

Parameter	Value
leftmargin	1.83 pc
rightmargin	1.83 pc
itemindent	0 pc
labelwidth	1.42 pc
labelsep	0.42 pc
listparindent	0 pc
topsep	0.33 pc
partopsep	0.17 pc
parsep	0.17 pc
itemsep	0.17 pc

Table 1: Tabulation of LaTeX list values, for the *quotation* environment.

$\text{\textheight } 598\text{ pt}$

```
1018 \def\printlistvalues{%
1019   \begin{tabular}{lr}
1020     \toprule
1021     Parameter & Value\\
1022     \midrule
1023     leftmargin & \convert@cx{\the\leftmargin}\\
1024     rightmargin & \convert@cx{\the\rightmargin}\\
1025     itemindent & \convert@cx{\itemindent}\\
1026     labelwidth & \convert@cx{\labelwidth}\\
1027     labelsep & \convert@cx{\labelsep}\\
1028     listparindent & \convert@cx{\listparindent}\\
1029     topsep & \convert@cx{\topsep}\\
1030     partopsep & \convert@cx{\partopsep}\\
1031     parsep & \convert@cx{\parsep}\\
1032     itemsep & \convert@cx{\itemsep}\\
1033     \bottomrule
1034   \end{tabular}
1035 }
```

13 Draw a Font box

We provide a command that can draw a box and font dimensions. We will use TikZ for drafting and styling. We also provide the macro `\printfontparams` to

$\text{\footskip } 30\text{ pt}$

$\text{\marginparsep } 11\text{ pt}$

$\text{oddsidemargin } 28\text{ pt}$

$\text{\textwidth } 380\text{ pt}$

$\text{\marginparwidth } 101\text{ pt}$

$\text{driver margin } 1\text{ in}$

1 in + \topmargin (1.42 pc) = 4.61 pc

\headheight 1 pc

\headsep 2.08 pc

print font parameters. This will produce a table as shown in Table 2 and Table 3.

Parameter	Value
Font encoding	T1
font family	fve
font series	m
font shape	n
font size	10
baselineskip	12.0pt

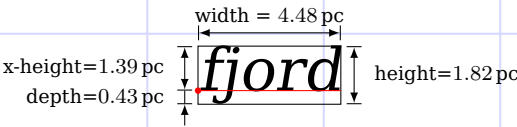

Table 2: Font details for the current document font.

Parameter	Value
fontdimen1 (slant per point) is	0.0pt
fontdimen2 (interword space)	2.86197pt
fontdimen3 (interword stretch)	1.71898pt
fontdimen4 (interword shrink)	0.68399pt
fontdimen5 (x-height)	4.67096pt
fontdimen6 (quad width)	8.99994pt
fontdimen7 (extra space)	0.68399pt

Table 3: Font dimension details for the current document font.

\textheight
49.83 pc

To draw a fontbox, we use

This draws  werty .

```
\printfontparams
1036 \newcommand{\printfontparams}{%
1037   \begin{tabular}{lc}

\marginparwidth 8.42 pc

1 in + \topmargin (1.42 pc) = 4.61 pc

Page 34

\headheight 1 pc

\headsep 2.08 pc

\printfontdimensions

```
1050 \newcommand{\printfontdimensions}{%
1051 \begin{tabular}{lc}
1052 \toprule
1053 Parameter & Value\\
1054 \midrule
1055 fontdimen1 (slant per point) is & \the\fontdimen1\font\\
1056 fontdimen2 (interword space) & \the\fontdimen2\font\\
1057 fontdimen3 (interword stretch) & \the\fontdimen3\font\\
1058 fontdimen4 (interword shrink) & \the\fontdimen4\font\\
1059 fontdimen5 (x-height) & \the\fontdimen5\font\\
1060 fontdimen6 (quad width)& \the\fontdimen6\font\\
1061 fontdimen7 (extra space) & \the\fontdimen7\font\\
1062 \bottomrule
1063 \end{tabular}
1064 }
```

\drawfontframe The macro \drawfontbox{<text>} draws text in a box and annotates it with dimensions. A very similar macro is defined in Peter Wilson's layouts. I thought with TikZ it can be drawn more easily than the tens of lines of put in the original macros.

We define some new length to hold temporary values for the fontbox dimensions, although PGF provides its own methods.

```
1065 \newlength\xheight@cx
1066 \newlength\xwidth@cx
1067 \newlength\xdepth@cx
1068 \newlength\xtotal@cx
1069 \newsavebox{\fontbox}
```

\textheight
49.83 pc

We set a number of keys to enable styling the box.

```
1070 \cxset{fontbox font/.store in=\fontboxfont@cx,
1071 fontbox line color/.store in=\fontboxlinecolor@cx,
1072 fontbox label font/.store in=\fontboxlabelfont@cx}
1073
1074 % Set reasonable defaults
1075 %
1076 \cxset{fontbox font={\itshape\Huge},
1077 fontbox line color=thered,
1078 fontbox label font={\upshape\footnotesize}}
```

Define a macro to draw a tight frame around text. This can be used for inline text and hence we use \tikz to define it. We align it using baseline=(X.base). See [\(How to align a series of tikz pictures at the baseline.\)](#)

See also [how to determine the vector between two co-ordinates.](#)

```
1079 \newcommand\drawfontframe[1]{%
1080 \tikz[baseline=(X.base), font=\fontboxlabelfont@cx]{%
1081 \node[rectangle,draw,inner sep=0pt,outer sep=0pt,

13.1 Sundry

Here are assorted macro definitions.

`\linelooop` The (document-level) command `\linelooop` sets numbered lines until the specified count is reached. The command `\linefoot` sets a single, automatically numbered line, but with a footnote (with the specified label); it automatically increments the line counter. These commands are typically used to construct test documents.

Because the counter is globally advanced and never reset, successive calls to `\linelooop` should have an argument ever larger. The formatted output will have each line labeled with its ordinal number.

```
1117 \newcounter{linecount}
1118 \def\loop@line#1#2{%
1119   \par

14 Minimal Working Examples (MWE)

We generate a number of examples to illustrate usage and to test the code. The first example test-01.tex, uses the standard book class. It also uses a number of pictures to illustrate float parameter placement.
