The xlayouts package. *

Dr. Yiannis Lazarides
yannislaz@gmail.com

2012/05/26

Résumé

Current layout packages, such as the layout and layouts packages do not easily permit, the drawing of grids. The package geometry darws a page layout, but does not indicate clearly what each line represents. The need for this package arose when I was developing different page layouts for chapter heads. It has a number of utilities, one of which is shown in this publication. An extensive list of styling options is provided via a key-value interface. The package also provides macros for readability checks.

$\text{\headsep } 25\text{ pt}$

1 How to use the package

The package is used like any other LaTeX package, by including it in the preamble :

```
\usepackage{xlayouts}
```

It is recommended that options be loaded using the `\cxset` macro.

```
% \cxset{geometry units=in}
```

2 Introduction

This package is a re-implementation of the Peter Wilson's layouts package. It follows the tradition originally implemented in the `layout.sty` of Kent McPher-son. It defines the command `xlayout` that draws the page geometry on the current page. The package offers additional features, such as styling commands and diverges from tradition, in that it shows the dimension lines and value labels, making understanding of the arithmetic involved easier. It works in all the major classes.

This manual is typesets according to the conventions of the LaTeX doc-strip utility which enables the automatic extraction of the LaTeX macro source files [GMS94].

3 Producing pages two-up

Sometimes it is instructive to view your own document in a two page view. This is probably easy with a viewer such as Acrobat Reader, but not so easy to print them on paper. We offer a facility to do this in the macros that follow :

$\text{\textheight } 598\text{ pt}$

4 Page Layouts

There are a number of ways you can include a page layout in your document.

5 Implementation

The implementation, uses PGF to set the key value parameters and TikZ to draw the layout. We try to avoid clashes with other packages by using the suffix `@cx` for all internal macros.

5.1 Dependencies

5.1.1 latex.ltx

5.1.2 xcolor.sty

`xlayouts's` colour handling depend on the `xcolor` package. The following internal macros are used directly : `\@declaredcolor`, `\current@color`, `\set@color`, `\set@page@color`

```
1 \IfFileExists{color.sty}{%
2 \RequirePackage{color}%
3 \let\needscolor@cx\@empty
```

$\text{\footskip } 30\text{ pt}$

$\text{\marginparsep } 11\text{ pt}$

$\text{oddsidemargin } 28\text{ pt}$

$\text{\textwidth } 380\text{ pt}$

$\text{\marginparwidth } 101\text{ pt}$

$\text{driver margin } 1\text{ in}$

1 in + \topmargin (17 pt) = 55.27 pt

Page 3

\headheight 12 pt

\headsep 25 pt

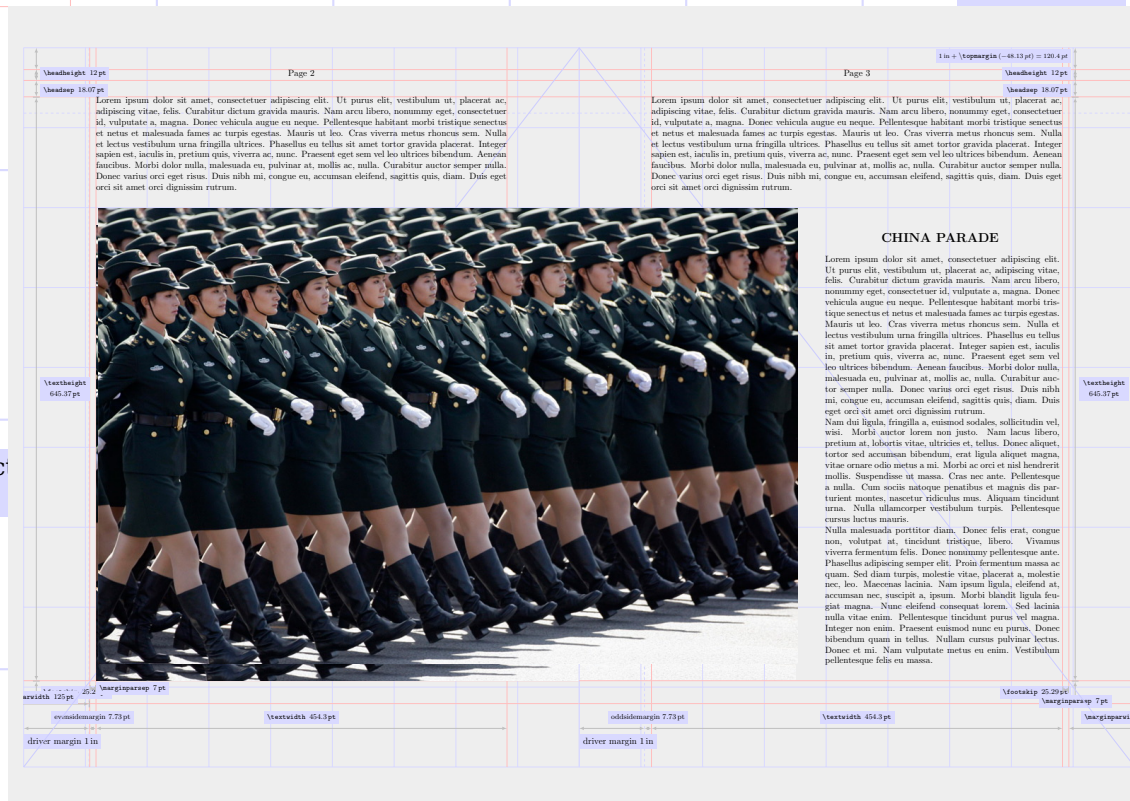

Figure 1 – Test

```
4    \}}
5    \RequirePackage{fp}
```

5.1.3 changepage.sty

We use the changepage to detect reliably if we are on an odd or even page.

```
6    %\IfFileExists{changepage.sty}{%
7    \RequirePackage{xcolor}
```

The package translator from Beamer's suite is used to internationalize some strings. This can make the diagrams more useful. Unsure at this stage how to pick it automatically from babel, if babel is used.

The loading of pgf can be problematic sometimes so we try and load it here.

```
8    \RequirePackage{changepage}
9    \RequirePackage{pgf}
10   \RequirePackage{pgfpages}
11   \RequirePackage{tikz}
12   \RequirePackage{amsmath}
13   \RequirePackage{fancyhdr}
```

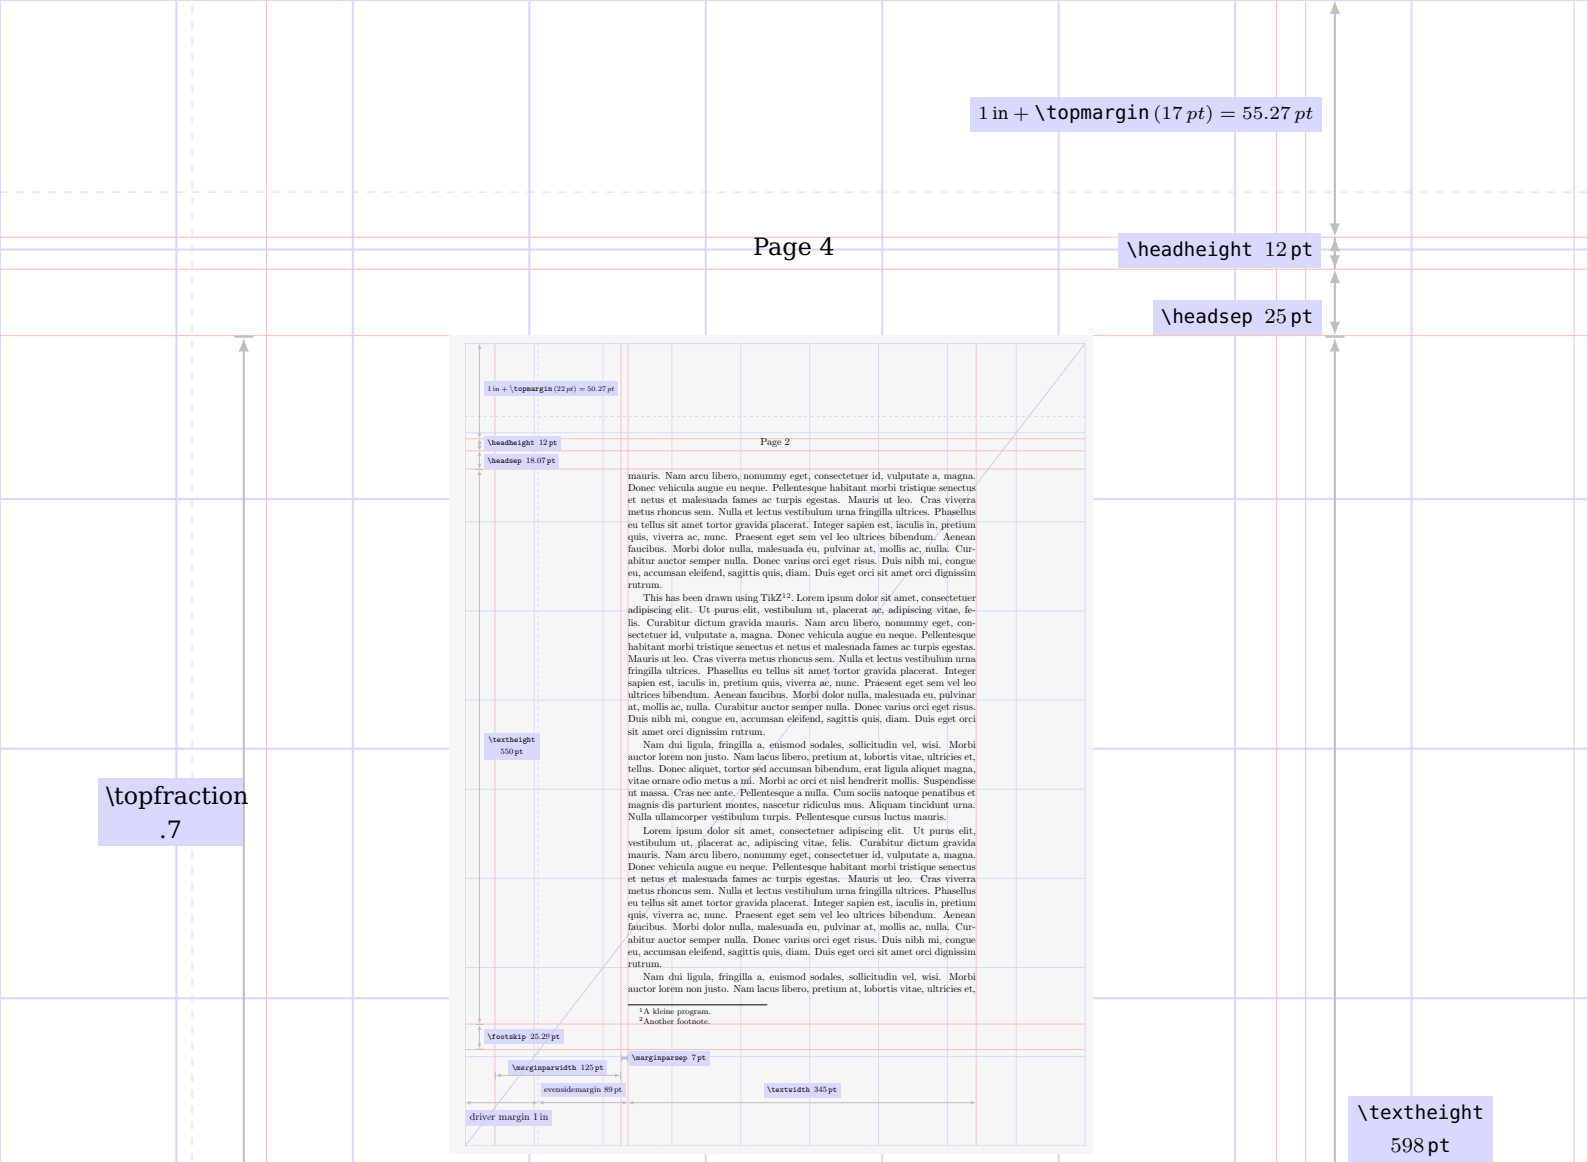

Figure 2 - Test

5.2 Internationalization

Most of the package options, are set via keys before drawing the layouts. However we provide some keys to set languages, if the option is passed via babel or through the package options.

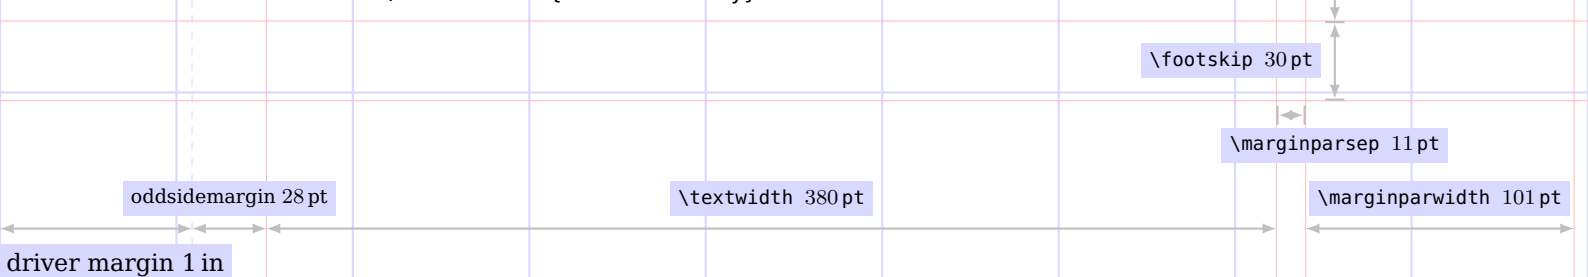

In the figures several words appear. They are stored in control sequences to be able to select a different language. Most of the languages I am unfamiliar with, so please if you can improve the spelling or find mistakes, let me know.

I have used for the first time in a larger Project the translator package.

If your language is not represented here, you can create a dictionary and perhaps send me a copy to include in the next release. First when we create a dictionary we give it a name. The name of the dictionary must start with its kind. The kind tells translator which kind of keys the dictionary contains. For example, the dictionaries of the kind translator-months-dictionary contain keys like January (note that this is a key, not a translation). Following the kind, the name of a dictionary must have a dash. Then comes the language for which the dictionary

le provides translations. Finally, the file name must end with .dict. Have a look at the one's provide with the package.

```
14 \@ifpackageloaded{babel}{%
15 \IfFileExists{translator.sty}
```

1 in + \topmargin (17 pt) = 55.27 pt

Page 5

\headheight 12 pt

\headsep 25 pt

```
16      {\RequirePackage{translator}\typeout{Translator package loaded.}}{}
17    }%
18    {\RequirePackage[french,dutch,german,italian,english]{babel}
19     \IfFileExists{translator.sty}
20      {\RequirePackage{translator}\typeout{Translator package loaded.}}{}
21
22    \usedictionary{pages}
23    \DeclareOption{german}{\uselanguage{german}}
24    \DeclareOption{english}{\select@language{english}\uselanguage{english}}
25    \DeclareOption{italian}{\select@language{italian}\uselanguage{italian}}
26    \DeclareOption{dutch}{\select@language{dutch}\uselanguage{dutch}}
27    \DeclareOption{french}{\select@language{french}\uselanguage{french}}
28    \ProcessOptions*
```

5.3 New lengths and switches

We need a few new lengths for arranging the grid and the layout. PH = paper height PW = paper width tol=tolerance toly = ytolerance

```
29    \newlength\shiftx@cx
30    \newlength\shifty@cx
31    \newlength\tol
32    \newlength\toly
33    \newlength\innermargin
34    \newlength\PH
35    \setlength\PH{\paperheight}
36    \newlength\PW
37    \setlength\PW{\paperwidth}
38    \newlength\INNER
39    \newlength\TOP
40    \newlength\alphlength
```

\textheight
598 pt

5.4 Colors

One of the reasons that I have created the package is to provide better looking layouts to be included in tutorials and or books, as such we define a number of colors to make it easy for users to redefine and change the looks.

```
41    \definecolor{theblue}{rgb}{0.02,0.04,0.48}
42    \definecolor{thered}{rgb}{0.65,0.04,0.07}
43    \definecolor{thegreen}{rgb}{0.06,0.44,0.08}
44    \definecolor{thelightgreen}{rgb}{0.06,0.44,0.06}
45    \definecolor{thegrey}{gray}{0.5}
46    \definecolor{thegray}{gray}{0.5}
47    \definecolor{thedarkgray}{gray}{0.95}
48    \definecolor{theshade}{gray}{0.94}
49    \definecolor{theframe}{gray}{0.75}
50    \definecolor{thecream}{rgb}{1,0.95,0.4}
51    \definecolor{spot}{rgb}{0,0.2,0.6}
52    \definecolor{boxframe}{gray}{0.8}
53    \definecolor{boxfill}{rgb}{0.95,0.95,0.99}
54    \definecolor{theoption}{rgb}{0.118,0.546,0.222}
55    \definecolor{themacro}{rgb}{0.784,0.06,0.176}
```

112      \fi
113      \fi
114      \fi
115      \fi
116    }
```

\convert@cx The macro \convert@cx is used internally to convert dimensions from one set of units to another. Used in dimension lines.

```
117      \newcommand\convert@cx[1]{%
118      \pgfmathparse{#1*\l@yunitperpt}
119      % use pgfmath for rounding to 2 decimals
120      \pgfmathprintnumber{\pgfmathresult}\thinspace\l@yunits
121    }
```

\calcshift@cx Helper command to reposition the grid, note it needs to run twice to position the grid properly.

```
122      \newcommand\calcshift@cx{%
123      \pgfsys@getposition{\pgfpictureid}\@basepoint
124      \pgf@process{\pgfpintorigin\@basepoint}%
125      \setlength\shiftx@cx\pgf@x
126      \setlength\shifty@cx\pgf@y}
```

\CS

```
127      \newcommand\CS[1]{\footnotesize #1}
```

\labelit@cx The macro \labelit@cx, is the main styling command for labels on dimensions this is expected to get more intelligent in future versions.

```
128      \newcommand\labelit@cx[1]{\ttfamily\CS{\string#1} \convert@cx{#1}}
```

We define its own family of keys.

\cxset The macro \cxset is used to either define a new key or set an existing one.

```
129      \newcommand\cxset{\pgfqkeys{/xlayouts}} %Notice this is pgf q keys
```

5.5 Keys

We are now ready to start defining keys. We use PGF Keys to define the keys.

```
130      \cxset{geometry units/.code=\printinunitsof@cx{#1},
131      geometry grid color/.store in=\geometrygridcolor@cx,
132      geometry lines color/.store in=\geometrylinescolor@cx,
133      geometry label color/.store in=\geometrylabelcolor@cx,
134      geometry diagonal/.is choice,
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

```

135     geometry diagonal/true/.code=\@diagonaltrue,
136     geometry diagonal/false/.code=\@diagonalfalse,
137     geometry diagonal/none/.code=\@diagonalfalse,
138     geometry diagonal color/.store in=\diagonalcolor@cx,
139     geometry dim arrow type/.store in=\geometryarrowtype@cx,
140     geometry grid xsteps/.store in=\xsteps@cx,
141     geometry grid ysteps/.store in=\ysteps@cx,
142     geometry grid line width/.store in=\geometrygridlinewidth@cx,
143     geometry driver lines/.store in=\geometrydriverlines@cx,
144     geometry driver lines color/.store in=\geometrydriverlinescolor@cx,
145 }

```

We set some defaults to initialize the keys and prevent errors, if the user doesn't specify any parameters.

```

146     \cxset{geometry diagonal=true,
147           geometry diagonal color=blue!20,
148           geometry lines color=pink,
149           geometry label color=blue!15,
150           geometry grid color=blue!15,
151           geometry grid line width=0.8pt,
152           geometry dim arrow type=latex,
153           geometry units=pt,
154           geometry grid xsteps=9,
155           geometry grid ysteps=9,
156           geometry driver lines=dashed,
157           geometry driver lines color=blue!15}

```

$$\text{\textheight} 598\text{ pt}$$

`\agrid` The macro `\agrid` is the main drawing command. It draws the layout.

```

158
159     \newcommand\agrid{%
160     \tikzset{lines/.style={color=\geometrylinescolor@cx},
161             dim/.style={color=black!25,thick,>=\geometryarrowtype@cx},
162             dim label/.style={color=black,fill=\geometrylabelcolor@cx},
163             grid/.style={line width=\geometrygridlinewidth@cx,
164                           color=\geometrygridcolor@cx},
165             driver/.style={\geometrydriverlines@cx,
166                             \geometrydriverlinescolor@cx}}
167

```

```

168     \begin{tikzpicture}[remember picture, overlay]

```

We need to detect if the layout is on an odd or an even page. We use the macro `\checkoddpage` from the `changepage` package. For oneside documents all pages are treated as odd and we set the switch to true.

```

169     \pgfmathsetlength{\TOP}{\PH-1in-\voffset-\topmargin-\headheight-\headsep}
170     \checkoddpage%
171     % for oneside we treat them as odd
172     \if@twoside\else\oddpagetrue\fi
173     \ifoddpage
174         \innermargin\oddsidemargin
175         \pgfmathsetlength{\INNER}{1in+\innermargin+\hoffset}
176         \gdef\innermarginname{\CS{oddsidemargin}}%
177     \else

```

$$\text{\footskip} 30\text{ pt}$$

$$\text{\marginparsep} 11\text{ pt}$$

$$\text{oddsidemargin} 28\text{ pt}$$

$$\text{\textwidth} 380\text{ pt}$$

$$\text{\marginparwidth} 101\text{ pt}$$

$$\text{driver margin} 1\text{ in}$$

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

```

178         \innermargin\evensidemargin
179         \pgfmithsetlength{\INNER}{1in+\innermargin+\hoffset}
180         \gdef\innermarginname{\CS{evensidemargin}}%
181     \fi

```

We need to shift the whole layout in order to achieve an integral number of grids this is done with `\calcshift@cx`¹.

```

182     \calcshift@cx
183     \begin{scope}[xshift=-\shiftx@cx, yshift=-\shifty@cx]

```

We will first draw the grid. This is one of the main features of the package. We do this using the `grid` shape. All `\draw` commands are detailed, rather than using coordinates. This was both for me as well as future maintainers that can follow easier the steps in drawing the layout. TODO option to skip the grid

```

184     %
185     \draw [grid, xstep=\PW/\xsteps@cx, ystep=\PH/\ysteps@cx]
186         (current page.south west) grid ++(\PW,\PH);

```

5.6 The driver margins

Printer's cannot always print up to the edges of the paper. Knuth allowed a one inch margin for this which later got adopted into LaTeX.

`\hoffset` Adjustment to the one inch margins can be made by using `\hoffset` and `\voffset`. All major classes set these offsets at zero. Some packages such as the `crop` may use these to center a logical page onto the stock paper.

```

187     \draw [driver] (1in,0) -- (1in,\PH);
188     \draw [driver] (0,\PH-1in)-- ++(\PW,0);

```

$$\text{\textheight} 598\text{ pt}$$

5.7 Crop marks

If the option `crop` is set, the package will print crop marks. These are printed at the four corners of the paper.

```

189     %\draw [line width=0.4pt,color= green]
190     % (0+8mm,\stockheight-30mm) circle(2.5mm)++(-2.5mm,0)
191     % -- ++(20mm,0)++(-17.5mm,-2.5mm)--++(0,5mm);
192     %
193     %\draw [line width=0.4pt,color=red,]
194     % (8+25mm,\stockheight-30mm+2.5mm) -- ++(0,20mm)
195     % ++ (0,-2.5mm)circle(2.5mm) ++(-2.5mm,0mm) --++(5mm,0);
196
197

```

5.8 Vertical lines

For no particular reason we first draw the vertical lines. We also define some co-ordinates to reduce the verbosity of the code.

```

198     \draw [lines] (\INNER,0) -- (\INNER,\PH);
199     \draw [lines] (\INNER+\textwidth,0) -- ++(0,\PH);
200     \ifoddpaper

```

1. See [discussion](#) at `tex.sx`

$$\text{\footskip} 30\text{ pt}$$

$$\text{\marginparsep} 11\text{ pt}$$

$$\text{\textwidth} 380\text{ pt}$$

$$\text{\marginparwidth} 101\text{ pt}$$

$$\text{driver margin} 1\text{ in}$$

1 in + \topmargin (17 pt) = 55.27 pt

Page 10

\headheight 12 pt

\headsep 25 pt

```
201 \draw[lines] (\INNER+\textwidth+\marginparsep,0)
202 -- (\INNER+\marginparsep+\textwidth,\PH);
203 \draw[lines] (\INNER+\textwidth+\marginparsep+\marginparwidth,0)
204 -- (\INNER+\marginparsep+\marginparwidth+\textwidth,\PH);
205 \else
206 \draw [lines] (\INNER-\marginparsep,0) -- ++(0,\PH);
207 \draw [lines] (\INNER-\marginparsep-\marginparwidth,0) -- ++(0,\PH);
208 \fi
```

5.9 Horizontal lines

Next we draw the horizontal lines.

```
209 \draw [lines](0,\PH-1in-\topmargin)-- ++(\PW,0);
210 \draw [lines](0,\PH-1in-\topmargin-\headheight)-- ++(\PW,0)
211 node[black,above] at ++(-0.5\PW,0){Page \thepage};
212 \draw [lines](0,\TOP) -- ++(\PW,0);
213 \draw [lines](0,\TOP-\textheight) -- ++(\PW,0);
214 \draw [lines](0,\TOP-\textheight-\footskip) -- ++(\PW,0);
```

5.10 Two column document

A two column document, just subdivides the text area into two equal parts with a gutter in between. Next we draw the vertical lines and the dimensions for two column layouts. We detect if it is a twocolumn layout using the switch \if@twocolumn defined by the standard classes in source2e.

\textheight
598 pt

\columnwidth
\columnsep

```
215 \if@twocolumn
216 \draw [lines](\INNER+\columnwidth,\TOP)-- ++(0,-\textheight);
217 \draw [lines](1in+\innermargin+\columnwidth+\columnsep,\TOP)
218 -- ++(0,-\textheight);
219 % Draw twocolumn dimension lines
220 \draw [dim,<->](\INNER, \TOP-\textheight-1.8em)
221 -- ++(\columnwidth,0) node[above, dim label]
222 at ++(-0.5\columnwidth,3pt) {\labelit@cx{\columnwidth}};
223 \draw [dim,<->](\INNER+\columnwidth, \TOP-\textheight-1.8em)
224 -- ++(\columnsep,0) node[above, dim label] at
225 ++(-0.5\columnsep,3pt) {\labelit@cx{\columnsep}};
226 \draw [dim,<->](\INNER+\columnwidth+\columnsep,
227 \PH-1in-\topmargin-\headheight-\headsep-\textheight-1.8em)
228 -- ++(\columnwidth,0) node[above, dim label] at
229 ++(-0.5\columnwidth,3pt) {\labelit@cx{\columnwidth}};
230 \fi
```

We then position and draw the dimension lines and labels.

```
231 \ifoddpage
232 \pgfmathsetlength\tol{1in+\innermargin+\textwidth+2\marginparsep}
233 \draw [dim, <->](\tol,\PH)-- ++(0,-1in-\topmargin);
234 \else
235 \pgfmathsetlength\tol{2\marginparsep}
236 \draw [dim, <->](\tol,\PH)-- ++(0,-1in-\topmargin);
237 \fi
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

$$1\text{ in} + \text{\topmargin} (17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

The top margin (not to be confused with the length `\topmargin`, is the total length given by the driver margin (which is `1in` + the `\topmargin` length + the `headheight` and `headsep`).

```

238   \pgfmathsetlength\@tempdima{1in-\topmargin}
239   \ifoddpage
240     \draw [dim](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
241       node[left, dim label] at
242         ++(-1ex,0.5in+0.5\topmargin+1.5em)
243         {\scriptsize$1\thinspace \text{\in}+\texttt{\footnotesize\textbackslash topmargin}\},
244         (\convert@cx{\topmargin})= \convert@cx{\@tempdima}$};
245   \else
246     \draw [dim, <->](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
247       node[right, dim label] at ++(1ex,1in-0.5\topmargin)
248         {\scriptsize$1\thinspace \text{\in}+\texttt{\footnotesize\textbackslash topmargin}
249         \, (\convert@cx{\topmargin})= \convert@cx{\@tempdima}$};
250   \fi

```

5.11 headheight and headsep

The `\headheight` is normally a fixed amount that varies with the baseline of the the font. In the standard classes it is defined in the `.clo` files. We position the lines and labels on the right for odd pages and on the left for even pages.

```

251   \ifoddpage
252     \draw [dim,<->](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
253       node[above left, dim label] at ++(-1ex,0){ \labelit@cx{\headheight}};
254   %   draw headsep
255     \draw [dim,<->](\tol,\PH-1in-\topmargin-\headheight)-- ++(0,-\headsep)
256       node[above left,dim label] at ++(-1ex,0){\labelit@cx{\headsep}};
257   \else
258     \draw [dim,<->](\tol,\PH-1in-\topmargin)-- ++(0,-\headheight)
259       node[above right,dim label] at ++(1ex,0){ \labelit@cx{\headheight}};
260   % draw headsep
261     \draw [dim,<->](\tol,\PH-1in-\topmargin-\headheight)-- ++(0,-\headsep)
262       node[above right, dim label] at ++(1ex,0){\labelit@cx{\headsep}};
263   \fi

```

$$\text{\textheight} 598\text{ pt}$$

5.12 Text height

The `\textheight` is normally calculated to have an exact number of lines to avoid warning messages from the TeX engine.

```

264   \draw [dim, |<->](\tol,\TOP)
265     -- ++(0,-\textheight) node[right,text width=1.7cm,text centered, dim label]
266     at ++(1ex,0.5\textheight){\labelit@cx{\textheight}};

```

5.13 The footskip

The `\footskip` is also a fixed number set by the classes. We position it left or right to minimize clashes with other elements.

```

267   \ifoddpage
268     \draw [dim, |<->](\tol,\TOP-\textheight)

```

$$\text{\footskip} 30\text{ pt}$$

$$\text{\marginparsep} 11\text{ pt}$$

$$\text{oddsidemargin} 28\text{ pt}$$

$$\text{\textwidth} 380\text{ pt}$$

$$\text{\marginparwidth} 101\text{ pt}$$

$$\text{driver margin} 1\text{ in}$$

1 in + \topmargin (17 pt) = 55.27 pt

Page 12

309   node[above, dim label] at ++(-0.5\textwidth,0.5em)
310   {\labelit@cx{\textwidth}};
```

5.14 Marginpar dimensions

\marginparwidth There are three controlling lengths that position the marginpar block. The marginparwidth is troublesome, in that some classes don't really worry about marginpars and they left the dimensions unchanged. For Octavo for some papers they will overflow outside the paper boundaries.

\marginparsep

\marginparpush

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

329     \draw[dim,<->](\INNER-\marginparsep-\marginparwidth, \toly+.95cm)
330       --++(\marginparwidth,0)node [above, dim label] at
331       ++(-0.5\marginparwidth,0em){\labelit@cx{\marginparwidth}};
332 \fi
333 \fi
```

5.15 Classic layout diagonal lines

\textheight
598 pt

We do not attempt to draw out a full classical layout, but only to draw the diagonal lines to check. This feature can be switched off. The direction of the line depends if we have an odd or even page.

```
334 \if@diagonal
335   \ifoddpage
336     \draw [\diagonalcolor@cx,thick] (\PW,0)--(0,\PH);
337   \else
338     \draw [\diagonalcolor@cx,thick] (0,0)--(\PW,\PH);
339   \fi
340 \fi
341 \end{scope}
342 \end{tikzpicture}}
```

6 Running head definitions

We define a page layout, grid to position the grid. We use the same for both evenhead and oddhead.

\ps@grid In LaTeX a running header is defined using a \ps@<name> macro. We define a pagestyle that can be use to draw the layout.

```
343 \def\ps@grid{%
344   \let\@oddfoot\@empty\let\@evenfoot\@empty
345   \def\@evenhead{\agrid}%
346   \let\@oddhead\@evenhead
```

\footskip 30 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 14

\headheight 12 pt

\headsep 25 pt

```
347 \let\mkboth\@gobbletwo
348 \let\chaptermark\@gobble
349 \let\sectionmark\@gobble
350 }
```

7 Float parameters

\figureparambot The macros \figureparambot attempt to draw dimension lines in figures. This is very much work in progress, as to draw them properly will need to redefine some of the internals of the output routine.

```
351 \def\figureparamsbot{%
352 \begin{tikzpicture}[remember picture, overlay]
353 \pgfmathsetlength\@tempdima{-\textfloatsep}
354 \draw[>=latex,|<->|] (0,0) --++(0,-\@tempdima)
355 node [right]
356 at ++ (1ex,-0.5\textfloatsep)
357 {\CS{textfloatsep} \convert@cx{\textfloatsep}};
358 \end{tikzpicture}%
359 \par
360 }
361 \def\figureparamstop{%
362 \par
363 \begin{tikzpicture}%[remember picture, overlay]
364 \pgfmathsetlength\@tempdima{-\textfloatsep}
365 \draw[>=latex,|<->|] (0,0) --++(0,\@tempdima)
366 node [right,fill=\geometrylabelcolor@cx]
367 at ++ (1ex,0.5\textfloatsep)
368 {\CS{textfloatsep} \convert@cx{\textfloatsep}};
369 \end{tikzpicture}%
370 }
```

\textheight
598 pt

8 Spread

The package provides a command to draw a two page spread as per the canons of page construction.

This is aimed at producing stand alone diagrams for inclusion into other packages or LaTeX notes, such a diagram is shown in Figure 3

```
371 \newlength\paperwidth@cx
372 \newlength\paperheight@cx
373 \newlength\lefttrim
374 \newlength\bottomtrim
375 \newlength\bindingcorrection
376 \setlength\paperwidth@cx{12in}
377 \setlength\paperheight@cx{18in}
378 \setlength\bindingcorrection{0.5in}
379
380 \cxset{spread xsteps/.store in=\spreadxsteps@cx,
381 spread scale/.store in=\spreadscales@cx,
382 spread width/.store in=\spreadwidth@cx}
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Figure 3 – Diagram illustrating page geometry as per the Canons of Page Construction.

```
383 %
384 %
385 \cxset{spread xsteps=9,
386         spread scale=0.25,
387         spread width=0.5\textwidth}% does not work
388
389 \tikzset{typearea/.style={color=black!85,fill=black!80,
390                             font={\sffamily\bfseries}}}
391 %
```

\textheight
598 pt

`\drawcanons` The macro `\drawcanons` draws a spread, showing all lines and divisions as per classical rules.

```
392 \def\drawcanons{%
393   \begin{tikzpicture}[scale=\spreadscales@cx]
394     % draw the two pages
395     \draw[xstep=(\paperwidth@cx)/\spreadxsteps@cx,
396           ystep=(\paperheight@cx)/\spreadxsteps@cx,color=gray] (0,0)
397       grid (\paperwidth@cx, \paperheight@cx);
398     \draw (0,0) rectangle (\paperwidth@cx,\paperheight@cx);
399
400     \begin{scope}[xshift=\paperwidth@cx+\bindingcorrection]
401       \draw[xstep=(\paperwidth@cx)/9,
402             ystep=(\paperheight@cx)/9,color=thegray] ++(0,0)
403         grid (\paperwidth@cx, \paperheight@cx);
404       \draw[color=black] (0,0) rectangle (\paperwidth@cx,\paperheight@cx);
405     \end{scope}
406   \end{tikzpicture}
407 }
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 16

\headheight 12 pt

\headsep 25 pt

Next we draw the binding correction. This is drawn as a rectangle. We fill it with the same style shading as the type area.

```
406 \draw[typearea, draw] (\paperwidth@cx,0)
407 rectangle ++(\bindingcorrection, \paperheight@cx);

The typed area blocks are added next.

408 \draw[typearea] (2\paperwidth@cx/\spreadxsteps@cx,
409 2\paperheight@cx/\spreadxsteps@cx)
410 rectangle ++(6/9*\paperwidth@cx,6*\paperheight@cx/\spreadxsteps@cx);
411
412 \draw[typearea] (\paperwidth@cx+\paperwidth@cx/9+\bindingcorrection,
413 2\paperheight@cx/9) rectangle ++(6\paperwidth@cx/9,6\paperheight@cx/9);
414
415 \ifdim\bindingcorrection>0pt
416 \begin{scope}[typearea,color=white]
417 \draw node at
418 (\paperwidth@cx+0.5\bindingcorrection,
419 0.5\paperheight@cx)[rotate=90,inner sep=0pt,outer sep=0pt]
420 {\translate{bindingcorrectionname}};
421 \fi
422 \node at
423 (0.5\paperwidth@cx,0.5\paperheight@cx){\translate{leftpagename}};
424 \node at
425 (1.5\paperwidth@cx+\bindingcorrection,
426 0.5\paperheight@cx){\translate{rightpagename}};
427 \end{scope}
```

\textheight
598 pt

Next we draw the diagonals and the circles. We draw them within a scope to separate the styling from the drafting.

```
428 \begin{scope}[color=orange, line width=1pt]
429 \draw (0,0)-- (\paperwidth@cx,\paperheight@cx);
430 \draw (2\paperwidth@cx+\bindingcorrection,0)--
431 ++(-\paperwidth@cx,\paperheight@cx);

The circles are drawn in the same style as the diagonals. We do not provide
an option to change this, as it will produce ugly diagrams.

432 \draw (0.5\paperwidth@cx,5\paperheight@cx/9)
433 circle (0.5\paperwidth@cx);
434 \draw [xshift=\paperwidth@cx+\bindingcorrection]
435 (0.5\paperwidth@cx,5\paperheight@cx/9)
436 circle (0.5\paperwidth@cx);
437 \end{scope}
438 \end{tikzpicture}
439 }
```

9 Try Layouts

The try layouts code, are helper macros to draw dimension lines on a diagram to experiment with different dimensions and layouts. In addition to this some helper commands are incorporated for readability.

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

10 Readability

In general the width of the typed area should not exceed 45-65 characters. This is language and reader dependent.

`\alphabet` The macro `\alphabet` returns the twenty six letters of the English language. This is used later on to calculate the length of an alphabet and provide related metrics for the readability of the text.

```
440 \def\alphabet{%
441   \normalfont\selectfont\raggedleft%
442   abcdefghijklmnopqrstuvwxyz}
```

`\charactersperline` The macro `charactersperline` typesets the number of characters in a line of text. We use `\pgfmathprintnumber` to format and print the number.

```
443 \newcommand\charactersperline{%
444   \settowidth{\@tempdima}{\alphabet}
445   \pgfmathparse{\textwidth/\@tempdima*26}
446   \pgfmathprintnumber{\pgfmathresult}
447 }
```

`\alphabetsperline` Some people are more familiar with the metric alphabets per line rather than characters per line. We provide the macro `\alphabetsperline`.

```
448 \newcommand\alphabetsperline{%
449   \settowidth{\@tempdima}{\alphabet}
450   \pgfmathparse{\textwidth/\@tempdima}
451   \pgfmathresult
452 }
```

\textheight
598 pt

`\alphabetlength` The macro `\alphabetlength` prints the length of the alphabet.

```
453 \newcommand\alphabetlength{%
454   \settowidth{\alphlength}{\alphabet}
455   \pgfmathparse{\alphlength}
456   \pgfmathprintnumber{\pgfmathresult}pt
457 }
```

We need to use the `fp` package to calculate the ratios, as PGF has problems with large dimensions or I am making an error

```
458 \newcommand\textarearatio{%
459   \FPMul{\result}{\strip@pt\textwidth}{\strip@pt\textheight}
460   \FPMul{\resulti}{\strip@pt\paperwidth}{\strip@pt\paperheight}
461   \FPdiv{\resultii}{\result}{\resulti}
462   \pgfmathprintnumber{\resultii}
463 }
464
465 % Calculate the ratio textheight/paperheight
466 \newcommand\textheightratio{%
467   \FPdiv{\result}{\strip@pt\textheight}{\strip@pt\paperheight}
468   \FPround{\result}{\result}{2}
469   \result
470 }
471
```

1 in + \topmargin (17 pt) = 55.27 pt

Page 18

\headheight 12 pt

\headsep 25 pt

```
472 % Calculate textheight/paperwidth
473
474 \newcommand\textheighttopaperwidth{%
475     \pgfmathparse{\textheight/\paperwidth}
476     \pgfkeys{/pgf/number format/.cd,fixed,precision=2}
477     \pgfmathprintnumber{\pgfmathresult}
478 }
479 \newcommand\numbertextlines{%
480 % baselineskip to be corrected
481     \pgfmathparse{(\textheight-\topskip)/(12)-1}\pgfmathresult
482 }
```

\printreadability

```
483 \def\printreadability{%
484 \begin{tabular}{lr}
485 Characters per line & \charactersperline\\
486 Alphabets per line & \alphabetsperline\\
487 Alphabet length & \alphabetlength\\
488 Baselineskip & \the\baselineskip\\
489 Number of text lines & \numbertextlines\\
490 \end{tabular}}
```

11 Page Layout Diagrams

This is one of the most important features of the package. Drawing and annotating a page diagram, so that you can view new geometry or use them for notes.

\textheight
598 pt

11.1 New lengths

We need to isolate the current page dimensions from the new trial sizes for the diagram. We redefine new lengths for all parameters with the prefix try and the suffix @cx.

```
491 \newlength\trypaperwidth@cx
492 \newlength\trypaperheight@cx
493 \newlength\trytextheight@cx
494 \newlength\tryheadheight@cx
495 \newlength\tryheadsep@cx
496 \newlength\tryfootskip@cx
497 \newlength\trymargin@cx
498 \newlength\trymarginbottom@cx
499 \newlength\trytopmargin@cx
500 \newlength\trimtop@cx
501 \setlength\trimtop@cx{0pt}
502 \newlength\trytextwidth@cx
503 \newlength\trymarginparwidth@cx
504 \newlength\trymarginparsep@cx
505 \newlength\tryleftmargin@cx

615 \cxset{try grid=true}
```

11.2 Allowances for trims

Throughout we are focusing on the average LaTeX user than might want to for example use A4 paper and trim down to a different size. We start from the stockwidth and stockheight and we set the paperwidth and paperheight to a smaller size to cater for these trims.

I call this process trimming in, whereas other packages such as the crop increase the paper size to allow for the trims, thus displaying a larger page. The memoir class has something similar.

```
\trypaperwidth@cx We set the length to stocksize-trimedge.
\trypaperheight@cx
616 % set the trial paper sizes as per trim sizes
617 \addtolength\trypaperwidth@cx{\trystockwidth@cx}
618 \addtolength\trypaperwidth@cx{-\trytrimedge@cx}
619 \addtolength\trypaperheight@cx{\trystockheight@cx}
620 \addtolength\trypaperheight@cx{-\trimtop@cx}
621 \addtolength\trypaperheight@cx{-\bottomtrim}
```

11.2.1 Calculating the Top Margin and Bottom Margin

We calculate the top and bottom margins for convenience. Remember that so far we are only dealing with default settings. If the user changes the dimensions, these will have to be recalculated.

```
622 %\addtolength\trymargintop@cx{1in+\voffset+\trimtop@cx}
623 %\addtolength\trymargintop@cx{\dimexpr\tryheadsep@cx+
624 % \tryheadheight@cx+\trytopmargin@cx}}
```

$\text{\texttt{\textbackslash marginparsep}}\ 11\text{ pt}$

$\text{\texttt{\textbackslash oddsidemargin}}\ 28\text{ pt}$

$\text{\texttt{\textbackslash textwidth}}\ 380\text{ pt}$

$\text{\texttt{\textbackslash marginparwidth}}\ 101\text{ pt}$

driver margin 1 in

$$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$$

$$\text{\headheight} 12\text{ pt}$$

$$\text{\headsep} 25\text{ pt}$$

11.2.2 Adjustments to text height

Since we are trimming-in, our paper height will end up being smaller than the stock paper height. One is thus faced with the decision to either make the top and bottom margins smaller to allow for the trimming or to reduce the text height accordingly.

Most people and publishers are fussy about margins, so perhaps it is better to reduce the text-height. We offer a method to the user to specify preferences later on. In the meantime for the purpose of defaults, we will take all the adjustment at the bottom margin and leave the text-height untouched.

```
\trytextheight@cx Let trytextheight@cx equal to the current document \textheight value.
625 \setlength\trytextheight@cx{\textheight}
626 \setlength\trymarginbottom@cx{%
627 \dimexpr(\trystockheight@cx-1in-\trimtop@cx-\trytopmargin@cx
628 -\tryheadheight@cx-\tryheadsep@cx-\trytextheight@cx)\relax}
629
630
631 \newlength\stepx
```

11.3 Drawing the Trial Layout

The trial layout is drawn in a lengthy TikZ picture. If no new dimensions are provided by the user it will default to the values we have set it previously. That is the current layout values.

`\drawtriallayout` The macro `\drawtriallayout` draws the page diagram. It uses throughout trial dimensions.

```
632 \tikzset{dim/.style = {color=black,>=latex}}
633 \def\drawtriallayout{%
    We first need to check if we are on an odd or even page and set the geometry
    accordingly. If the document is one-side we default to drawing everything as an
    odd-side page.
634 \checkoddpage%

667     {paper width = \convert@cx{\trypaperwidth@cx} $(W_p)$};
668 }
```

11.3.1 Draw stock paper

First we draw the stockwidth and stockheight

```
669 \draw [color=thegray] (0,0) rectangle
670     ++(\trystockwidth@cx,\trystockheight@cx);
671
672 % draw the paper if trims are defined and no book size given
673 % the paper width is then defined by the dashed blue line
674 \ifoddpage
675     \draw [book trim] (0+\lefttrim,\trystockheight@cx-\trimtop@cx)
676         rectangle ++(\trystockwidth@cx-\lefttrim-\trytrimedge@cx,
677             -\trystockheight@cx+\trimtop@cx+\bottomtrim);
678     \drawpaperwidthdim
679 \else
680     \draw [book trim] (0+\lefttrim+\trytrimedge@cx,\trystockheight@cx-\trimtop@cx)
681         rectangle ++(\trystockwidth@cx-\lefttrim-\trytrimedge@cx,
682             -\trystockheight@cx+\trimtop@cx+\bottomtrim);
683     \drawpaperwidththevendim
684 \fi
685
```

\textheight
598 pt

11.3.2 Draw grid

Unlike the grid on page spreads we provide a conditional to switch it off if necessary. It set to true by default.

```
686 \pgfmathsetmacro{\gridx}{10}
687 \iftrygrid
688     \ifoddpage
689         \draw[xstep=(\trypaperwidth@cx-\lefttrim)/\gridx,
690             ystep=\trypaperheight@cx/\gridx,color=thegreen!50,
691             line width=0.4pt,yshift=\bottomtrim,xshift=\lefttrim]
692             (0,0) grid (\trypaperwidth@cx-\lefttrim,\trypaperheight@cx);
```

\footskip 30 pt

\marginparsep 11 pt

oddsidemargin 28 pt

\textwidth 380 pt

\marginparwidth 101 pt

driver margin 1 in

1 in + \topmargin (17 pt) = 55.27 pt

Page 24

\headheight 12 pt

\headsep 25 pt

```
693 \else
694 \draw[xstep=(\trypaperwidth@cx)/\gridx,
695 ystep=\trypaperheight@cx/\gridx,color=thegreen,
696 line width=0.4pt,yshift=\bottomtrim,xshift=\trytrimedge@cx]
697 (0,0) grid ++(\trypaperwidth@cx,\trypaperheight@cx);
698 \fi
699 \fi
```

11.3.3 Drawing the binding correction

The binding correction is added to the stockheight. It will appear on the opposite site in the even page.

```
700 \ifoddpage
701 \draw (0, \trystockheight@cx + 3mm) -- ++ (0,1cm)
702 ++ (\lefttrim,-1cm) -- ++(0,1cm) ++(-1cm-\lefttrim,-0.5cm)[->,>=latex]
703 -- ++(0.5cm+\lefttrim,0);
704 \draw (0, \trystockheight@cx + 3mm)
705 ++ (0,0.5cm) -- ++ (\lefttrim,0)
706 ++(1cm,0cm)[->,>=latex]-- ++(-1cm,0cm)

744 {\CS{textheight} \convert@cx{\trytextheight@cx}\
745 $(h_x)$ };
746

```

11.3.4 Book height

Book sizes are specified by the size of the final trimmed sizes. for most users there is no need to worry about trims and binding corrections, however we provide these for consistency and for books that are perhaps to be sent to an on-line bureau for printing.

```

747 \draw [dim,<->] (-4.7cm,\bottomtrim) --
748 (-4.7cm,0.5\trystockheight@cx-0.5\trimtop@cx)
749 node[left,text width=1.2cm,text centered,dim text]
750 {\translate{bookheightname}\ \convert@cx{\trypaperheight@cx}} --
751 (-4.7cm,\trystockheight@cx-0.5\trimtop@cx) ;

```

11.3.5 Draw the edge trim

The paper is always assumed to be trimmed at top bottom and the edge margin. We first draw the edge trim and its dimension.

```

752 \ifdim\trytrimedged@cx>0pt
753 \ifoddpaper
754 \coordinate (D) at (\trystockwidth@cx-4\trytrimedged@cx,
755 0.10\trytextheight@cx);
756 \coordinate (E) at (\trystockwidth@cx,0.10\trytextheight@cx);
757 \draw [dim,->] (D) -- ++(3\trytrimedged@cx,0);
758 \draw [dim,<->] (E) -- ++(3\trytrimedged@cx,0)
759 node at ++(0,0) [right,text width=2cm,dim text]
760 {\translate{trimedgename}\
761 \convert@cx{\the\trytrimedged@cx}
762 $(\Delta_e)$};
763 \else
764 \coordinate (D1) at (0, \trystockheight@cx+ 5mm);
765 \coordinate (E1) at ++ (\trytrimedged@cx,\stockheight+\trimtop@cx);
766 \draw (D1) -- ++ (0, 10mm) ++(\trytrimedged@cx,0) -- ++(0,-10mm) ;
767 \fi
768 \fi

```

$$\text{\texttt{\textbackslash textheight}}\ 598\text{ pt}$$

11.3.6 The top trim

The top trim is drawn next. As it is very small normally we try not to crowd the label and the dimension lines. We will only show it if it has a value.

```

769 %\ifdim\trimtop>0pt
770 \coordinate (F) at (0.9\trystockwidth@cx,\trystockheight@cx-\trimtop@cx-8mm);
771 \coordinate (G) at (0.9\trystockwidth@cx,\trystockheight@cx-\trimtop@cx);
772

```

$$\text{\texttt{\textbackslash footskip}}\ 30\text{ pt}$$

$$\text{\texttt{\textbackslash marginparsep}}\ 11\text{ pt}$$

$$\text{\texttt{\textbackslash oddsidemargin}}\ 28\text{ pt}$$

$$\text{\texttt{\textbackslash textwidth}}\ 380\text{ pt}$$

$$\text{\texttt{\textbackslash marginparwidth}}\ 101\text{ pt}$$

$$\text{driver margin } 1\text{ in}$$

$1\text{ in} + \text{\topmargin}(17\text{ pt}) = 55.27\text{ pt}$

Page 26

$\text{\headheight } 12\text{ pt}$

$\text{\headsep } 25\text{ pt}$

```
773 \coordinate (H) at (0.9\trystockwidth@cx,\trystockheight@cx);
774 \draw (F)[dim,->|,>=latex] -- (G);
775 \draw (H) -- ++ (0,8mm) -- ++ (5mm,0)[|<-|,>=latex]
776 node [text width=2cm, right] at ++ (0,3pt) {\translate{trimtopname}\
777 \ \convert@cx{\the\trimtop@cx} {\Delta_t}$};
778 %\fi
```

11.3.7 Driver offsets

Next we draw the driver offsets. The lines are drawn at the left side of the paper both for even and for odd paper. Of course they are meaningless if the printer is going to print them on an A3 paper for example, and then the paper is trimmed.

```
779 \draw[fill=olive] (lin,\trystockheight@cx-lin) circle (1.5mm);
780 \draw[dashed,color=olive] (lin,0) -- (lin,\trystockheight@cx);
781 \draw[dashed,color=olive] (0in,\trystockheight@cx-lin)-- ++ (\trystockwidth@cx,0);
782 \draw [dim,|<->|](0,0.3cm)-- (lin,0.3cm) node at (0.5in,0.6)[dim text] {\translate{oneinch
```

Draw the inner margin. We use innermargin which has already been set to either oddsidemargin or evensidemargin

```
783
784 % Draw left = lin + innermargin
785 \setlength\tryleftmargin@cx{\dimexpr(lin+\innermargin)}
786 \draw [dim,|<->|] (0in,1.9cm) -- (lin+\innermargin,1.9cm)
787 node at (0.6in,3.2cm)[text width=lin,dim text,text centered]
788 {\$(w_i)$\ \convert@cx{\tryleftmargin@cx}\inner margin};
789
790 \draw (lin,1.2cm)[|<->|] -- ++(\innermargin,0) node[right,dim text]

12.1 Tabulating List values

\printlistvalues The command \printlistvalues produces a short table showing the list parameters and their values (see Table 1 for an example).

Parameter	Value
leftmargin	1.83 pc
rightmargin	1.83 pc
itemindent	0 pc
labelwidth	1.42 pc
labelsep	0.42 pc
listparindent	0 pc
topsep	0.31 pc
partopsep	0.16 pc
parsep	0.16 pc
itemsep	0.16 pc

Table 1 – Tabulation of LaTeX list values, for the *quotation* environment.

```
1012 \def\printlistvalues{%
1013   \begin{tabular}{lr}
1014     \toprule
1015     Parameter & Value\\
1016     \midrule
1017     leftmargin & \convert@cx{\the\leftmargin}\\
1018     rightmargin & \convert@cx{\the\rightmargin}\\
1019     itemindent & \convert@cx{\itemindent}\\
1020     labelwidth & \convert@cx{\labelwidth}\\
1021     labelsep & \convert@cx{\labelsep}\\
1022     listparindent & \convert@cx{\listparindent}\\
1023     topsep & \convert@cx{\topsep}\\
1024     partopsep & \convert@cx{\partopsep}\\
1025     parsep & \convert@cx{\parsep}\\
1026     itemsep & \convert@cx{\itemsep}\\

1028   \end{tabular}
1029 }
```

\textheight
49.83 pc

13 Draw a Font box

We provide a command that can draw a box and font dimensions. We will use TikZ for drafting and styling. We also provide the macro \printfontparams to print font parameters. This will produce a table as shown in Table 2 and Table 3. To draw a fontbox, we use

\footskip 2.5 pc

\marginparsep 0.92 pc

oddsidemargin 2.33 pc

\textwidth 31.66 pc

\marginparwidth 8.42 pc

driver margin 1 in

1 in + \topmargin (1.42 pc) = 4.61 pc

\headheight 1 pc

\headsep 2.08 pc

Parameter	Value
Font encoding	T1
font family	fve
font series	m
font shape	n
font size	10
baselineskip	12.0pt

Table 2 – Font details for the current document font.

Parameter	Value
fontdimen1 (slant per point) is	0.0pt
fontdimen2 (interword space)	2.86197pt
fontdimen3 (interword stretch)	1.71898pt
fontdimen4 (interword shrink)	0.68399pt
fontdimen5 (x-height)	4.67096pt
fontdimen6 (quad width)	8.99994pt
fontdimen7 (extra space)	0.68399pt

1056   \bottomrule
1057   \end{tabular}
1058 }
```

`\drawfontframe` The macro `\drawfontbox{<text>}` draws text in a box and annotates it with dimensions. A very similar macro is defined in Peter Wilson's layouts. I thought with TikZ it can be drawn more easily than the tens of lines of put in the original macros.

We define some new length to hold temporary values for the fontbox dimensions, although PGF provides its own methods.

```
1059   \newlength\xheight@cx
1060   \newlength\xwidth@cx
1061   \newlength\xdepth@cx
1062   \newlength\xtotal@cx
1063   \newsavebox{\fontbox}
```

We set a number of keys to enable styling the box.

```
1064   \cxset{fontbox font/.store in=\fontboxfont@cx,
1065         fontbox line color/.store in=\fontboxlinecolor@cx,
1066         fontbox label font/.store in=\fontboxlabelfont@cx}
1067
1068   % Set reasonable defaults
1069   %
1070   \cxset{fontbox font={\itshape\Huge},
1071         fontbox line color=thered,
1072         fontbox label font={\upshape\footnotesize}}
```

Define a macro to draw a tight frame around text. This can be used for inline text and hence we use `\tikz` to define it. We align it using `baseline=(X.base)`. See [\(How to align a series of tikz pictures at the baseline.\)](#)

See also [how to determine the vector between two co-ordinates.](#)

```
1073   \newcommand\drawfontframe[1]{%
1074     \tikz[baseline=(X.base), font=\fontboxlabelfont@cx]{%
1075       \node[rectangle,draw,inner sep=0pt,outer sep=0pt,
1076         color=\fontboxlinecolor@cx] (X)[black]{#1};
1077       \draw[\fontboxlinecolor@cx, line width=0.4pt] (X.text)
1078         circle(0.4pt)[fill=red] -- (X.base east);}
1079   }
1080   %
1081   \def\drawfontbox#1{%

13.1 Sundry

Here are assorted macro definitions.

\linelooop The (document-level) command **\linelooop** sets numbered lines until the specified count is reached. The command **\linefoot** sets a single, automatically numbered line, but with a footnote (with the specified label); it automatically increments the line counter. These commands are typically used to construct test documents.

Because the counter is globally advanced and never reset, successive calls to **\linelooop** should have an argument ever larger. The formatted output will have each line labeled with its ordinal number.

```

14 Minimal Working Examples (MWE)

We generate a number of examples to illustrate usage and to test the code. The first example test-01.tex, uses the standard book class. It also uses a number of pictures to illustrate float parameter placement.
